Speaking of "reputable news organizations" I got U.S. News and World
Report today and it is dated March 6, 2006. Many of their ads are for
DRUGS. Yes, DRUGS, were on the front and back of SEVEN pages.
Actually, only six of them were two page ads. One of the seven had a
two page spread AND then took the back of the second page. So at least
15 pages of an 80 page magazine were for DRUGS!

I suspect some of those defending ol' Dickie Boy have been using too
many of those, or other, drugs! :-)

2. Iranian mullahcracy boasts of "big" oil deal to come with Communist China

Iranian mullahcracy boasts of "big" oil deal to come with Communist

Mehdi Safari, the deputy foreign minister for the mullahs, told the regime's propaganda television that a "delegation led by the Chinese head of the national development and reform commission, Ma Kai, will be soon in Tehran to sign agreements related to exports of big oil consignments to China"
...
http://sg.biz.yahoo.com/060225/1/3yytl.html

Communists looking for more Canadian resources

China National Petroleum Corporation (CNPC) is "eyeing a takeover of a major Canadian oil company - possibly Husky Energy Inc. or Canadian Natural Resources Ltd. - to gain a stake in Alberta's oil sands"
...
http://www.theglobeandmail.com/servlet/story/LAC.20060225.RTICKERMAIN25/TPStory/National

---

Communists offer to replenish Bolivia's missile stash

The Communist regime has "offered to replace shoulder-fired missiles" that Bolivia lost last year after local military officers helped the U.S. destroy them, lest they "fall into the hands of terrorists linked to the new ruling Movement to Socialism." The Communists' missile offer goes in tandem with "Beijing's long-term strategy to undermine U.S. influence in the region and other parts of the world."

Provident junkies, known as squirrels, keep stashes against a bust.
Every time I take a shot I let a few drops fall into my vest pocket,
the lining is stiff with stuff. I had a plastic dropper in my shoe and
a safety pin stuck in my belt. You know how this pin and dropper
routine is put down: "She seized a safety pin caked with blood and
rust, gouged a great hole in her leg which seemed to hang open like an
obscene, festering mouth waiting for unspeakable congress with the
dropper which she now plunged out of sight into the gaping wound. But
her hideous galvanized need (hunger of insects in dry places) has
broken the dropper off deep in the flesh of her ravaged thigh (looking
rather like a poster on soil erosion). But what does she care? She
does not even bother to remove the splintered glass, looking down at
her bloody haunch with the cold blank eyes of a meat trader. What does
she care for the atom bomb, the bedbugs, the cancer rent, Friendly
Finance waiting to repossess her delinquent flesh...Sweet Dreams,
Pantopon Rose."
The real scene you pinch up some leg flesh and make a quick stab hole
with a pin. Then fit the dropper over, not in the hole and feed the
solution slow and careful so it doesn't squirt out the sides...

What made them loony?

If I were a Democrat and I told you that the sun rises in the East worldwide, and sets in the West worldwide, would that make me a loony?

If I told you that most likely you are going to live your life, pay taxes while you are doing it, and then at a certain point the groundhog will become your mailman, does that make me "loony" just because I'm a Democrat?

If I tell you that the Sun is thousands of degrees hot and is about 93 million miles from Earth, does that make me a loony just because I'm a Democrat?

If I as a Democrat tell you that sticking a hairpin in an electrical socket will do grave injury to you, does that make me a "Loony?"

If I tell you that George Bush ignored the wise advice of his weapons inspectors, and many in the CIA and elsewhere in his maniacal rush to attack two countries neither of which had anything to do with 911, causing the deaths of tens of thousands of babies,, children and American troops, does that make me a "loony" even though it is 100% verifiable?

My point is that if what a person is telling me can be verified as factually correct, then I don't care what their political persuasion maybe. I will listen to what they have to say.

Their are loonies in all political parties and outside of them also Their are also wise people of all political persuasions.

Their seem to be an even larger number of idiots who totally disregard what a person has to say if they are not of the political party that that the finger pointing person espouses.

Free your MIND Running Dog of all this liberal conservative garbage...and your ass will follow!

I have posted my reception reports for February 2006 on my shortwave weblog. I am located in Northern California, and primarily used Sony ICF SW7600GR and Eton E5 receivers.

This month's received stations are:
* British Broadcasting Corporation
* China Radio International
* KBS South Korea
* Radio Australia
* Radio Canada International
* Radio Havana Cuba
* Radio Netherlands
* Radio New Zealand International
* Radio Slovakia
* Radio Taiwan International
* Radio Thailand
* Voice of America
* Voice of Croatia
* Voice of (North) Korea
* Voice of Russia
* Voice of Vietnam
* WBCQ

"No Vaseline"

Got damn, I'm glad ya'll set it off.
Used to be hard, now you're just wet and soft.
First you was down with the AK,
and now I see you on a video with Michel'le?
Lookin' like straight bozos.
I saw it comin', that's why I went solo.
And kept on stompin',
when ya'll mothafuckers moved straight outta Compton.
Livin' with the whites, one big house,
and not another nigga in site.
I started off with too much cargo,
dropped four niggas now I'm makin' all the dough.
White man just rulin'.
The Niggas With Attitudes -- who ya foolin'?
Ya'll niggas just phony,
I put that on my mama and my dead homeys.
Yella Boy's on your team, so you're losin';
Ay yo Dre, stick to producin'.
Callin' me Arnold, but you Been-a-dick;
Eazy E saw your ass and went in it quick.
You got jealous when I got my own company,
but I'm a man, and ain't nobody helpin' me.
Tryin' to sound like Amerikkka's Most,
you could yell all day but you don't come close.
Cuz you know I'm the one that flown,
ya done run 100 miles, but you still got one to go.
With the L-E-N-C-H M-O-B, and ya'll disgrace the C-P-T.
Cuz you're gettin' fucked out your green by a white boy,
with no vaseline...

[Refrain]
[L.L. sample:] "Now you're gettin' done without vaseline..." [3x]

[Biz Markie sample:] "Damn, it feels good to see people...on it"

The bigger the cap, the bigger the peelin',
who gives a fuck about a punk-ass villain?
You're gettin' fucked real quick,
and Eazy's dick, is smellin' like MC Ren's shit.
Tried to tell you a year ago,
but Willie D told me to let a hoe be a hoe, so
I couldn't stop you from gettin' ganked,
now let's play big-bank-take-little-bank.
Tried to dis Ice Cube, it wasn't worth it
cuz the broomstick fit your ass so perfect.
Cut my hair and I'll cut them balls,
cuz I heard you're, like, givin' up the drawers.
Gang-banged by your manager, fella,
gettin' money out your ass, like a mothafuckin' Ready Teller.
Givin' up the dollar bills,
now they got the Villain with a purse and high-heels.
So don't believe what Ren say,
cuz he's goin' out like Kunte Kinte,
but I got a whip for ya Toby;
used to be my homey, now you act like you don't know me.
It's a case of divide-and-conquer,
cuz you let a Jew break up my crew.
House nigga gotta run and hide,
yellin' Compton, but you moved to Riverside.
So don't front, MC Ren, cuz I remember when you drove a B 2-10.
Broke as a mothafuckin' joke.
Let you on the scene to back up the Verse Team.
It ain't my fault, one nigga got smart,
and they rippin' your asshole apart.
By takin' your green, oh yeah,
the Villain does get fucked with no vaseline.

[Refrain scratched]

I never have dinner with the President.
I never have dinner with the President.
I never have dinner with the President.
And when I see your ass again, I'll be hesitant.
Now I think you a snitch,
throw a house nigga in a ditch.
Half-pint bitch, fuckin' your homeboys.
You little maggot; Eazy E turned faggot.
With your manager, fella,
fuckin' MC Ren, Dr. Dre, and Yella.
But if they were smart as me,
Eazy E would be hangin' from a tree.
With no vaseline, just a match and a little bit of gasoline.
Light 'em up, burn 'em up, flame on...
till that Jheri curl is gone.

On a permanent vacation, off the Massa plantation.
Heard you both got the same bank account,
dumb nigga, what you thinkin' bout?
Get rid of that Devil real simple, put a bullet in his temple.
Cuz you can't be the Nigga 4 Life crew
with a white Jew tellin' you what to do.
Pullin' wools with your scams, now I gotta play the Silence of the Lambs.
With a midget who's a punk too,
tryin' to fuck me, but I'd rather fuck you.
Eric Wright, punk, always into somethin', gettin' fucked at night.
By Mista Shitpacker, bend over for the gotdamn cracker, no vaseline...

....

Yeah, Fuck whitey! Cracka ass crackas.

Bureau of Meteorology
HF (high frequency) radio
Marine Weather Broadcasts On-line Survey
http://www.bom.gov.au/survey/hf/

The Bureau of Meteorology is conducting a survey to gather information on the usefulness of its HF marine weather broadcasts and ways to improve the service.

If you are a mariner who uses HF radio to receive weather forecasts and warnings from the Australian Bureau of Meteorology's transmitters at Charleville (call sign VMC) and Wiluna (call sign VMW) we would appreciate your time in completing a short on-line survey.

To access the survey please click-on the link below.

Survey

If you wish to complete the survey off-line and post to the Bureau separately, you can do so by downloading and printing a copy below (40kb). Please note that you must download Adobe Acrobat Reader (available free from ADOBE) to open the PDF file .

PDF Document

Why are we seeking feedback?

The Bureau of Meteorology commenced this service on 1 July 2002 to replace coast radio station broadcasts. A new system was commissioned by the Bureau to provide a dedicated weather service for mariners. This system provides both automated voice and radiofax broadcasts.

We are keen to hear from all users of the Bureau's marine HF radio service about its usefulness and any suggestions you may have to improve or enhance it.

Please note. This survey closes on 31 March 2006.

Well here's a solution for all you Nazis: Swap places with the Israelis.
You and all of your Nazi friends can have Israel and the Israelis can
have your homes. I'll bet once they've cleared away all of the broken
down washing machines from the front yards they'll commence to
being a real benefit to their adopted communities.

45. Orbitcast Top Ten Talkers List

Newsgroup: rec.radio.shortwave
Date: 2006-03-01 12:53:04 UTC
From: David <rickets@knac.com>
Message-ID: <g86b02l62pnoc7d8h19vltlvpi8tplsuki@4ax.com>
Source record: 65436

Sooo, as a result, let's make our own list - Orbitcast's Top Talkers in 2006! Because... we're more relavent. :) This list is based on "courage, effort, impact, longevity, potential, ratings, recognition, service, talent and uniqueness" and therefore must be true. Check out the REAL list after the jump...

Orbitcast's Top Talkers for 2006:

1. Howard Stern
2. Bubba The Love Sponge
3. Scott Ferral
4. James Carvelle and The Other Guy
5. Bob Edwards
6. Ron & Fez
7. Broadminded
8. Ellen DeGeneres
9. Bill O'Reilly
10. Oprah

Following the Top 10, Orbitcast readers will be surprised to read that Opie and Anthony came in at #245 because they suck.

Asshole? Hey, back off there Zippy. I was playing with you. Your posts
are often caustic, disrespectful, and rude. I was just tweaking you a
little. No need to loose your mind.

A little known story about Dennis Weaver: He was at a party once at the
Playboy mansion. He and Hugh Heffner got into a little argument which
escalated and became physical. At one point Heff had Weaver pinned on the
floor when Mic Jagger ran up and said: "Hey, Hugh, get offa McCloud!"

Source record: 65441

What I was pointing out about this radio was that it was "supposedly"
a restored radio. For me, its hard to warrant 2000 dollars for a
perfect one much less one that has a bent chassis and being sold as
close to perfect. Of course, that is martyn for you. I bought a 390A
in mint condition and in the case for 650. Of couse, it is very close
to perfect and that is top dollar for me. I find it's cheaper to get
one that is complete and ready to go versus one that you can get for
300 that need a total makeover.

Heard Chuck Harder yesterday afternoon at the regular time, and he did not sound well at all.
I can't stand the guy or his far, far, far, far, far, far, far, far-Right politics (he makes Pat Buchanan sound like a moderate), but I do feel sorry for him, in a sense.
His tenacity and pluck are admirable, but I feel he's done his job. He never really intended to "bring the jobs back to America" (his oft-stated goal), but he did make millions of listeners think about things like national sovereignty, trade, manufacturing, the UN, immigration, and so on.
I hope others can pick up on Harder's nationalism, and tweak it just a bit so that it's more palatable to the average voter. GOP chairman Ken Melhman is right: Anger, paranoia, and conspiracy theories don't win elections (just ask Ross Perot).

The punch card machines were not properly maintained. This is the
result of having partisans in charge of the election apparatus. Same
deal in Ohio, they sent junk to Democratic neighborhoods and shiny new
stuff to the Republican areas.

Yeah, I fly enough that I've seen several flight crews that were able to tell if someone was using a cell phone. The give-aways include holding it to their ear, appearing to be talking to nobody and looking intently at a small electronic device.

I hope they continue the ban on cell phones. Being confined in the close surroundings of an airplane at 35,000 feet surrounded by bozos on cell phones trying to overcome the already high ambient noise level is not an unappealing thought.

I'm working on it but I have only captured some basic details so far.

Positives:
* E5 with the "wide" setting seems to have clearer audio on shortwave
than the SW7600GR
* Memory system is more intuitive on the E5 due to alphanumeric
labeling and the use of F1-F7 for stations
* E5 has a non-muting tuning knob
* Direct frequency entry on the E5 is very nice; just type the
frequency then the band button (am or fm)

Negatives:
* no sync detect in the E5, so fading is a problem
* E5's narrow setting seems too narrow
* really sucks down batteries (someone in a Yahoo group told me the
Kaito/Degen 1103 does the same)

Source record: 65364

Dear Cuhulin,

J&R Music World puts the Sony ICF-SW7600GR "on sale" periodically as does Amazon.com. If you do a Google search, you will find listings of other companies which sell it as well. The lowest price I have ever seen for a new, factory-warranted, unit, is $109.00. (That price was at Bennett Brothers when they were discontinuing the item. By the time I ordered from them - two days after receiving their sale catalog - they were sold out.) Generally, shipping is extra and these shipping costs are all over the board. You must check carefully. The absolute best price I have seen recently, and that I could actually get, was Amazon's - $129.15 including shipping (and no sales tax) which they offered this past November and December. They may offer that price again.

It would be nice to support the radio distributors on this item but their price is, frankly, not competitive. They sell the radio for $159.95 (true list price thoiugh Sony and some others claim $199.95 - a "phony" list price) plus shipping. Though the radio is certainly not "overpriced" at $159.95, if I can purchase it for less, I will do so, as will most people. That's what competition is all about!

I might mention that I would personally avoid "gray-market," "used," or "eBay sellers." I would also avoid "refurbished" units (even from Sony itself).

If you don't mind paying a bit more, then you can buy at the lowest currently-offered price. If you want the "rock-bottom" price, then you must be patient and check the various web sites frequently and buy when you see a good price. Do be careful and make sure the dealer from whom you buy is reputable. As you know, J&R Music World and Amazon.com are two extremely fine dealers.

Best to you and best of luck to your friend.

Joe

P.S. Obviously you are as pleased with your '7600GR as I am with mine.

To really answer your question, I have not fully compared reception performance yet. The SW7600GR has the sync detect but that can make a signal noisier in some cases. I would be surprised if one radio proved to be noticeably stronger than the other.

Don't let your expectations get too high. Most of us go off topic. I suppose even knitters might talk about coal mining from time to time. I know I've been off topic in the past, and I'll probably do it again. But some off topic posters get boring. There may even be some hopeless bores in knitting circles.

Just think of the killfile as the usenet equivalent of responding with a blank expression and not really listening.

Dear all,

Usualy, people use 9:1 balun to connect a wire or dipole antenna to a 50 ohm coax.

If I use a basic TV coax (75 ohms) I suspect I will need a 6:1 balun instead. If so, how many turns of wire should I use for primary and secondary windings ?

I don't know the impendance of the antenna connection of my radios (ATS 909 + ICF SW100), so I intend to give a try with the coax I have in hand.

Thanks in advance for your help,

Charly

Cell phones ARE Radios.(look in your cell phone owners/operators literature)Two way radios that use "repeaters" (cell phone towers and other places where cell phone repeaters are used.Some of them are disguised as trees,gas station signs etc.I was outside a short while ago and the blonde Bell South woman next door was vacuuming out the other womans car.She found the other womans cell phone under the the front seat of the car.The other woman thought she had lost her cell phone (how is that possible since they have their cell phones glued to their ears all the time?) and she bought a new cell phone.

Good afternoon,

Yes, I have those one on my PC already... I think I have found most of the articles dedicated on that topic.

But since I don't know exactly what is my toroï¿½d material and constant values for computation (I got my toroï¿½d from a broken power supply) I was wondering wether there was some "classical" windings spec...

Perhaps I will begin with a 1:1 balun (it should be the same number of turns for both windings, right ?) and then start from that point to find a better configuration.

Thanks anyway,

Charly

For receiving applications with some random length of wire, your antenna impedance will be all over the map. However, since the wire length tends to be on the short side, i.e compared to the frequency you are receiving, the antenna impedance tends to be much higher than 50 ohms. Thus the use of the 9:1 step up. Since nothing will be optimal here, you basically want some sort of step up to keep the match in the ball park. It's not that exact of a science. Transmitting is another story.

The DC/DC converters tend to be used in the 100Khz range, so I'd expect the core not to be so good above a few MHz. For a DC/DC, .you are concerned with keeping the current in the coil high, i.e. near saturation if you are designing on the edge. It is a different application from RF.

The 75 ohm coax will be going into the radios 50 ohm input so that's
another problem.

What part of the power supply did the toroid come from? A toroid from
the EMI filter part of the supply would probably work well. If you have
the test equipment you could put one turn on the toroid and measure the
inductance. Also you could check the inductance over frequency to see
where that particular toroid will work.

Barring that use the minimum turns for a 9:1 anyway. Use a twisted or
overlapping method to wind the core. The antenna wire impedance will
change based on the wire diameter and height above ground so you need to
calculate that before you know what impedance ratio you would need to
begin with. Some people confuse the reactance of the wire with the wires
characteristic impedance, which is what you are trying to match. The
reactance of the wire will change with frequency.

A resonant dipole, I believe, is about 72 ohms. Connecting it through
75 ohm TV coax to a 50 ohm receiver input should be a near ideal
match.

On non-resonant frequencies, the dipole will present different
matches. That shouldn't be a problem, though, just for listening on a
sensitive receiver.

A balun won't give you a decent match except on the single frequency
it is designed for. That's one problem you run into, putting a balun
on a multi-band or multi-frequency antenna.

If it's a coax-type connector, the input should be about 50 ohms. If
it's screw terminals or a plug-in terminal, I'm guessing it's for
higher-impedance antennas like a random end-fed wire.

That's not the point.

One of the big rules in impedance matching is that the load (gozinta)
have equal or higher impedance than the source (gozowta). You never
go from a HiZ generator into a LoZ cable. Major faux pas.

If the antenna's highest impedance is 450 Ohms, and it's going through
a 9:1 matcher it will never be choked by a 50 (or 75) Ohm cable.

Think of impedance as hose diameter and the signal as a solid stream
of water.

"According to a Washington Post investigation, "inColumbus, Cincinnati and
Toledo, and on college campuses, election officials allocated far toofew
voting machines to busy precincts, with the result that voters stood on line
as long as 10hours - many leaving without voting."

Even this doc states it was the lack of machines not the types. Perhaps if
the largely Democratic areas could vote without standing at the machine for
an hour it wouldnt have been a problem.

No mention of punchcard machines in your link.

Mostly a lot of conspiracy theories and quotes from op-ed pieces.

The frequency 6005 was used many years ago by the Democratic Yemen Broadcasting Service (Aden).

The 1983 WRTH shows 5970,6005,7190 and 11770 being used. All at 100 kW.

Here is the station ID from the 1983 WRTH: Idha'at al Jumhuriyah Al-Yemen Al-Dimucratia Ash-Shabeya Min Aden.

6005 was QSL'd here in 1984.

Why do you think an antenna for multi-frequency use has an impedance
no higher than 450 ohms? As an example, check the impedances of the
all band doublet at http://www.cebik.com/wire/abd.html

I've met plenty of white men like that.

>The female character's role is consistently controlling, mature and responsible.

That's because we dont think with our dicks and stomachs. Most of us
are also mentally equipped to handle childlike behavior because we have
less testosterone and a strong maternal instinct, which is a scientific
fact, and a lot of grown men are just big babies, so it works out
perfectly.

> If the commercial has Black and white roles, the non-jewish white guy is
> submissive, immature, and inept. The Black character will act in a
> mature, authoritative and controlling.

The only commercials I can recall with white and black men in them have something to do with football, and then everyone is equally loud and obnoxious.

> The non-jewish white male
> character will often be of lower social/professional status than the
> character portrayed by the Black male (who will invariably have a
> deeper, more manly voice).

That's mostly a physical attribute, dumbass. Many Black men are taller and more muscular too. That's why White men cant jump.

I think what you're saying can be seen as a truthful account, in some sense, as far as the Black/White binary in movies goes. There are more Black heros and more White villans nowadays, but the way I see it is that Black actors are finally getting thier chance to be something more in movies than token parts as butlers and cooks and whatever, before the 60s there were lots of villan (or lazy, irresponsible) parts for Blacks in movies and every hero was White.

There are lots of immature, ignorant, goofy people in EVERY RACE, including WHITE FOLKS. I think you should hang around more people out of your own ethnic background and see that people share common things that don't belong only to White people. Everyone recognizes the same emotions. Everyone knows and understands more than you think they do, or at least what you can tell on the surface or by how well they speak "White english." As opposed to "Black english" or "Asian english" because guess what: it's all ENGLISH. BTW, You'd look like a complete retard to the natives if you were in Zimbabwe trying to speak "African English." So who's the better one in that situation? You because you're the only White person around? Or everyone else in the area who have no idea what the hell you're saying and see that you refuse to take any kindness or hospitality from them? The truth is neither, because you are put in an akward situation, and they simply don't understand you because you can't speak thier kind of english.

I guess what I'm trying to get to is that NO ONE is "clean", mentally, emotionally, or intellectually from BIRTHRIGHT. People are RAISED to be stupid and violent in every race, because OTHERS think they can't be smart and civilized. That's why Columbine and countless other school shootings happened in unassuming White neighborhoods. That's why some Black people join gangs and drop out of school. I'm not trying to say it's not thier individual fault. They choose that path and reap the consequenses. I'm not trying to be all "give peace a chance" bleeding heart lovey-dovey equality for everyone and shit. Because, like the Avenue Q song, "Everyone's a little bit racist." You can be sympathetic, but you can't actually experience how a Black person feels when they are ridiculed by a White unless you are Black and it's happened to you before, although I wish a lot of people could switch bodies and memories with a "mud" or a homosexual or a Jew and know what it feels like to be called a nigger or a faggot or a Christ killer and know they are talking about YOU and YOUR WAY OF LIFE and YOUR PEOPLE.

Maybe showing blonde Whites as stupid bastards and bimbos is a good thing. I think the White community deserves a little bit of it's own medicine. You can either decide to be violent and stupid about it, blow up Black churches, drag gay people behind trucks until they die, try to start a war to divide the races, etc, but all you are proving is that you're no more violent and stupid than the supposedly violent and stupid people you hate. Or you could write composed, non-degrading letters to Congress, have peaceful protests in front of abortion clinics, and put White Supremacy flyers under people's windshield wipers, which is Just As Bad because that shows people that you are angry and violent on the inside but they think you're a pussy because you don't give them any spectacle to hate you with, or they realize you're trying to get other people to be violent and stupid for you. (That's also the problem with peace protesters and boycotters and flyer hander outers on the other end of the spectrum.)

So what the hell are you supposed to do with all your hatred? Dont supress it. You'll just explode. Talk about it to a therapist? Maybe. Expand your knowledge about other races, read books by other races, play games with other races, talk to other races at work and school, live in a predominatley non White neighborhood? Bingo. (and the Black neighborhoods not being safe thing is bull, I lived in a very White neighborhood and my tires got slashed twice, my house robbed by my backwoods hick neighbors adopted kids, and my other neighbor was raped by a WHITE MAN.) Living somewhere with different peoples is a good way you can gain more understanding of them and they can gain more understanding of you. There's no reason not to be proud of a White heritage, my family is from Germany and Denmark, but there is a reason not to take it so far that you hate everyone else that's not from Germany and Denmark. But I guess I'm not really going to change your mind. I just had to get it out of my system and give you something to think about besides, "Youre a stupid racist mother fucker!"

Antenna reactance and impedance are two different things. The antenna impedance in this case is a characteristic of the single wire or a dipole. The first case is hundreds of ohms and the second about 72 ohms. And like you stated in another post in the thread he does not need a BALUN for the dipole.

The purpose of a BALUN, UNUN or other types of impedance matching device is to match the characteristic impedance of the antenna to the transmission line, which in this case is the coax.

The impedance transformers do not tune the antenna and don't deal with antenna reactance to a certain frequency.

It seems people make this mistake all the time.

Sure, I was off-topic with my OP! My point was . . .

I
> suppose even knitters might talk about coal mining from time to time.

Then go to the coal mining NG & discuss it there, for (I hope) obvious
reasons . . .

I
> know I've been off topic in the past, and I'll probably do it again. But
> some off topic posters get boring. There may even be some hopeless bores
in
> knitting circles.

I'm sure there are, but the (obvious) reason knitters, or cola miners for
that matter, get together is to discuss the topic primarily; usually if a
group of humans get together to discuss something & the discussion gets too
far off topic, someone will say "ok, back to the subject please!"
>
> Just think of the killfile as the usenet equivalent of responding with a
> blank expression and not really listening.

Yup, exactly! The NG looks so much better already now that I have my
killfile online!

Got my DX-302 today - MAN! Is this a receiver!

- Built-in preselector
- Preselector fine tune
- RF Gain
- BFO
- Attenuator switch
- Selectivity switch
- does CW, LSB, USB, AM
- Good sized receiver
- Lotsa lights, dials & switches

They all should be built like this! Workds quite well off my Eavesdropper "C"!

144. (ot) Red Star Over San Francisco

Newsgroup: rec.radio.shortwave
Date: 2006-03-02 01:19:39 UTC
From: SeeingEyeD0g <looking@u.org>
Message-ID: <120ci4n9358v000@corp.supernews.com>
Source record: 65634

Red Star Over (and in) San Francisco

San Francisco, California, boasts its own Human Rights Commission and bills itself as a bastion of tolerance, diversity and inclusion. It didn't quite work out that way when members of Falun Gong wanted to showcase their heritage in the 2006 Chinese New Year parade. They found themselves branded as a "homophobic cult" in the San Francisco Chronicle and banned from the parade. That led some observers to compare the San Francisco experience to what happens in the People's Republic of China, where Falun Gong is persecuted to the point of death.
...
In San Francisco there can be no worse accusation than "homophobic." Sherry Zhang, a Falun Gong spokeswoman and a chemist from Los Altos, told anybody who would listen that the group has teachings on homosexuality similar to those of Christian groups, but that Falun Gong has never spoken out expressly against homosexuality. It apparently escaped the notice of San Francisco's vocal Homintern that in the People's Republic of China, which has occupied Tibet since 1959, homosexuality is still considered a capitalist vice and that the Communist regime has imprisoned and even executed homosexuals. Chinese persecution of gays, or any of the regime's massive violations of human rights, has never been an issue in San Francisco, which is more agitated by U.S. military recruiters, Abu Ghraib, and even support for the war in Iraq by Nancy Pelosi.
...
In former times, the Chinese parade in San Francisco featured the flag of Taiwan, whose nationalist government commanded loyalty of many in Chinatown, along with business owners and politicians. That changed when Dianne Feinstein, now a U.S. Senator, became mayor in 1978. She wanted to encourage trade with China. That has come to pass, along with tolerance for its repressive policies.

In San Francisco, the only official concerned about the persecution campaign is Supervisor Chris Daly. In 2001, he authored a resolution condemning persecution of Falun Gong. It failed to pass, falling to opposition spearheaded by Rose Pak, a former journalist known as the "dragon lady of Chinatown" and reportedly San Francisco"s most powerful person outside of elected office. Pak accompanied then-mayor Willie Brown on junkets to Beijing, where Communist Party bosses accorded them red carpet treatment.

Communist growing military fueling geopolitical ambitions

Communist China's military is expanding, especially its "nuclear missiles, ships and submarines -- with the apparent goal of expanding its power throughout Asia"
...
http://www.washingtontimes.com/national/20060228-110029-3691r.htm

---

At present, we are being led to believe that the "Muslim world" (keep in mind, the overwhelming majority of Muslims are not allowed to speak at all unless it serves the purposes of the ten-cent general, overly powerful political hack, or fatwa-addicted cleric that has the nation in which he or she lives locked in a despotism) is speaking out against the cartoons because of the offense to Islam. This is giving certain apologists the opportunity to mention Iraq, Palestine, and other supposed crimes of the planet's non-Muslims against the faith.

Yet the Chinese Communist Party - a regime that specifically places itself in Muhammed's place as Allah's last prophet, has occupied a Muslim nation for over 56 years (East Turkestan) , and has killed over 210,000 Muslims within that occupied nation through open-air nuclear tests (yes, you read that right) - gets a pass. Osama Bin Laden and his fellow terrorists have demanded the Israelis evacuate Palestine, the Americans leave Iraq, and the Spanish abandon Spain, but they have said absolutely nothing about Communist China's atrocities - which also include shooting political prisoners, razing mosques to the ground, and banning all East Turkestani children from attending any mosques still standing.

So why would a bunch of violent killers claiming they murder in Islam's name try to remind everyone of the medieval Crusades while staying silent on an occupation during which more Muslims have died than during all eight Crusades combined?

If your answer had something to do with the Communists' aid to terrorists, you're right.

It's just off of the Northeast Extension of the PA Turnpike (Landsdale
exit - the first one going north fron the East/West Turnpike), in
Kulpsville, PA at the Best Western hotel (see below). It is the 19th
annual shortwave winterfest.

Complete info at http://swlfest.com/

You may be able to email John Figliozzi (Co-Chairman), John Figliozzi
<jfiglio1@nycap.rr.com>, if you can still get Banquet Tickets. You
can register at the door but would not be able to get banquet tickets,
however you would be able to attend the post-banquet raffel drawing
for the great raffel prizes - yes you can buy tickets then.

Here is info from the site:

"Checks should be made payable to Winter SWL Festival. Register
directly with the hotel for your rooms by calling the Best Western at
+1 (215) 368-3800. For 2006, one special rate $75 single or double!
Tell the hotel staff you're with the Winter SWL Festival to receive
this special room rate. You must make your reservation directly with
the hotel to receive this rate; reservations via the Best Western 800
number or web site are not eligible for this rate. Up to the minute
information can be found on the Winter SWL Festival Web site at
http://swlfest.com/. (The Web site also contains maps, related links,
and photos of past events.)

The Best Western--The Inn at Towamencin is located at Exit 31 of the PA Turnpike Northeast Extension-Lansdale Interchange. Improved access from the south with the Blue Route (I-476)--ask for details. Limo service is available from Phila. Intl Airport directly to the hotel."

Look at the website for any questions - hurry if you plan to attend - a great time for any radio fans.

Warren

Drought Comes Again to East Africa

By CHRIS TOMLINSON
The Associated Press
Sunday, February 19, 2006; 6:24 PM

BISSEL, Kenya -- Babies in East Africa are starving again.

They lie in battered beds, hooked up to IV drips, their skeletal mothers beside them. Their cries are barely audible for now, but their woes won't end when they have gained weight. All of their families' wealth _ their cattle and goats _ are dead.

When drought comes, the very young and the very old are the first to suffer. But according to the latest U.N. figures, they are only the most visible of 11.5 million East Africans who don't have enough to eat.

Hunger strikes Africa for reasons as diverse as its 53 countries _ drought, locusts, government policies that wreck the agricultural economy.

In East Africa, which includes Kenya, Somalia, Ethiopia, Sudan, Tanzania and Uganda, drought arrives every few years, usually predicted months in advance.

Drought does not have to cause hunger, but inevitably it does.

Breaking the cycle wouldn't take much: just the vision and enough money to provide clean water, distribute electricity and build some roads.

Cattle are grazing the suburbs again.

Says the moo-cow of the NOW!

Hi.

Good price ($129.00), decent shipping charge (to Mississippi) -
$4.99).

Here's an oddity, however. If you look up the Sony ICF-SW35, the price,
while okay ($78.95) has a shipping charge (to Mississippi or New
Jersey) of $8.88. This is odd because the ICF-SW35 weighs less than the
ICF-SW7600GR.

As I said in my other post here, shipping charges are all over the
place, often making no sense whatsoever.

However Etronics' current price for the ICF-SW7600GR (total with
shipping $133.99) is a good one.

Best,

Joe

Thought we heard somthing different last night. They had and English
news broadcast we listened to for about 1/2 hour.

Could get a good station I.D. though.

Thanks for the info,

John

You have a nice receiver there, I hope you enjoy it. I own an old Drake SSR1 from the 70's, that they had built in Japan, and it has a Wadley Loop tuner, that is Analog, with two dials, and I love it. It's sensitive, stable and accurate as can be. I also have an Old Kenwood R-300, with Twin Drum tuning that is a real peach and a great sensitive Dx-er, and still in excellent condition. So, I hope you enjoy many fine hours of great Dxing from you new prize.

I didn't even understand the point of that post. Is portraying Africa's declining condition an argument against accepting different races? I'll attempt to interperet your, and defend my, argument.

God hasn't chosen Africa to die because it's full of Black people. It's politics and bad farming. They might know about a drought coming, but what the hell are they supposed to do about it? Just because we KNEW New Orleans would probably be drowned by a hurricane, that doesn't mean everyone in New Orleans could just up and leave. Where are the Africans going to go? Thier summer home in the Hamptons? Plus they're using modern fertilizing "improvements" from Western agriculturalists that are drying out the land even more, and it gets worse every year.

If America wasn't rich in fertile lands that we stole from Native Americans, (or convinced them to leave to move to land that's about as bad as Africa is now), then we'd be lying around starving to death, contracting malaria and smallpox and AIDS. Everyone forgets that if we hadn't had help from Native Americans, we would have all died within a few decades and no one would have dominated the land through "manifest destiny" that didn't belong to us in the first place.

And another thing, where the hell are they going to get all the labor they need to connect all the tiny villages scattered across the desert by roads and electricity? At least 20 MILLION people of the African population has AIDS. Many of the people left are orphaned children who can barely support themselves, and are forced to take care of thier brothers and sisters, too. Africa doesn't just need money, they need more qualified people to serve as doctors, nurses, laborers, and messengers. The grassroots groups that are actually trying to help people get connected and help AIDS victims dont see most of the money America is throwing at the government because there aren't enough people that are able to help. They can't even afford bicycles to GET to the villages!!!

My point in mentioning Zimbabwe in the last post was only that I wanted to pick a country full of Black people as an example of someplace mullah would be considered a complete moron.

Oh yeah here's a link for you all who may ask for one:

You're right for once. The West Germans made some really good radios at a time when America and Japan was turning out tinny sounding crap. A lot of GIs stationed in West Germany bought these radios and brought them home to the US because they were so good. AND they run on 115v as well as 220v (European power was uneven and unreliable) so all somebody had to do was replace the power cord and voila a great radio. The only problem is that many only go up to 100 Mhz on the FM band because Germany didn't have many FM stations.

Did you ever see any old pictures of white people lynching other white people? Even when white people were killed back then even for obvious madmen, there was a fair trial and a slightly dignified excecution. When a black man did something wrong, anything, theres a good chance someone would lynch you before you even had a chance to go to jail, if you had one before a trial that is.

There's a hell of a lot of racial profiling going on in the world. Lots of white guys do horrible shit, but on the news, if anything like that happens, guess what? A Black guy did it. And white people get away with it, too! Police are just waiting for a young Black male to fuck up and don't even give a shit when a white guy makes meth in his living room!

DX-302 Communications Receiver
(200-0220) Features Faxback Doc. #
45535

...It All Comes Alive on your Realistic DX-302 Communications Receiver

The entire world is at your fingertips with the Realistic DX-302.
English
language broadcasts can be heard from such world capitals as London,
Tokyo,
Paris, Rome, Berlin and Moscow. Exotic music and unusual languages
can be
heard from stations located in distant, isolated sections of the
world.
You might listen in as the Coast Guard aids a vessel in distress, or
perhaps eavesdrop as the skipper of a fishing boat radios back news of
the
day's catch. Airplanes, both civilian and military, use radio to keep
in
touch on intercontinental flights. Radio amateurs (commonly known as
'hams') can be heard chattering away around the clock with friends
located
in the next town or on the other side of the world.

Your DX-302 is designed to tune a wide variety of signals from 10 kHz
to 30
MHz. It receives AM (Amplitude Modulation), CW (Continuous Wave,
better
known as Morse code) and SSB (Single sideband) signals. It also has
superb
sensitivity and selectivity to dig out distant and low-powered
stations.

The synthesized drift-cancelling triple-conversion mixer system
provides
thirty tunable ranges from 10 kHz to 30 MHz, and is derived from a
single 4
MHz quartz oscillator. This results in precise frequency control and
superior frequency stability. A stable low frequency kHz Tuning
circuit
covers the 1 MHz increments and the 5-digit display shows the exact
frequency.

The DX-302 uses 39 transistors (10 of which are field-effect type), a Large-Scale Integration IC frequency counter, 3 integrated circuits, 32 diodes, 5 seven-segment LED displays and six LEDs.

You can use the DX-302 at home (on 120 volts AC for USA/CANDADIAN models and 220/240 volts for EUROPEAN/AUSTRALIAN models or 12 VDC (8 "C" cells) or in your car or vehicle (12 Volts DC negative ground).

Main features are:

* Quartz controlled frequency synthesizer
* Continuous frequency coverage from 10 kHz to 30 MHz
* Large digital frequency display
* Triple conversion circuit
* Six element and nine element ceramic filters provide outstanding selectivity (freedom from adjacent channel interference)
* Dual MOS Field-effect transistor in the critical mixer stage (freedom from cross-modulation and undesirable RF distortion)
* All silicon solid-state circuitry for maximum circuit efficiency with minimum noise
* Audio power IC provides high intelligibility sound
* AC or DC (negative ground) operation
* If the AC power should fail, an automatic circuit switches over to the battery power with no interruption of sound

The DX-302 uses a Wadley loop synthesized circuit for continuous frequency coverage. With this design, it is normal to find beat notes on such frequencies as 910 kHz and 1,000 MHz. Such beat notes indicate your DX-302 is working properly. The effects of such beat notes can be reduced simply by trying a different external antenna or readjusting the outer (MHz) tuning knob.

>

Well, I have a degree in international development.
I have been watching statistics. Yes, there is a difference
between the Hamptons and Zimbabwe. If the Black Man
is starving, and he/she/it can jump, why don't y'all just
jump on over to the Hamptons and knosh on a knish?
Or for that matter, why are y'all not jumping up and down
with the Mexicans in Houston after leaving New Orleans,
or why are the Mexicans kicking your bootays in LA
an San Francisco? Mexcians can't jump, except for
the Mexican jumping beans, and Mexicans are looking
for work in front of the 7-11 every morning, they aren't
laying out up in the crib with some clapped-out white
crack ho'

So, my plan is to re-populate Africa with Mexicans.
They are well suited to dry-land conditions, they work
hard, don't whine and piss and moan, and they always
have good weed at fair prices and never be selling no
oregano like the brothuhs who smoke the shit and fuck
your women and then want to know why you done 'em
wrong. "I got de blooz, wah, wah, wah, 'cuz de White Man
done me wrong! wah, waaaah! WOOOO, I got de doo-rag,
on my haid too tight, makin' my eyeballz stick out like a
toad runned over on de roohoad! Yo, y'all! I gots de
sufferin shits goin' on up in de hizzy! Whooop! Pha!

Yeah, there were LOTS of white people that got lynched.
Cattle rustlers, horse thieves, bushwhackers, scum and varmints.
There is a list of lynching victims online that includes whites,
but it's not fair to require a rope to classify it. You see a roach,
step on it.

When the Indians are circling the wagon train,
you are going to help to reload rifles, or are you
going to get on your laptop and look for "Men of Colour"
to fellate? Just askin'...

Wasn't that the time that chemical exports to Iraq increased ten fold?
even after the embargo, the European subsidiaries of the US corporations
were circumventing the blockade. What a bunch of hypocrites.

I'd also read that the village that was gassed was done so by IRANIAN
chemicals. They were different than the US supplied ones.

mike

Telamon Wrote:
> How is the audio sound quality on the E5 with a good signal and the wide
> bandwidth?

Hi Telamon:
I'm listening to Radio Havana Cuba on 6000 khz right now (0519 UTC).
Both the E5 and my SW7600GR are tuned to it. Both radios have their
news/music switches set to music. The E5 seems to produce higher
frequencies, but the SW7600GR produces more lower frequencies.

In an effort to explain this effect without knowing the exact frequency
ranges involved, imagine frequencies on a 1-10 scale (from low to high).
I'd say the SW7600GR frequencies are in the range of 2-6 and the E5
frequencies are in the range of 4-8.

Initially I had a slight preference for the E5's speaker output, but
now I'm focusing on the lower frequencies from the SW7600GR and wonder
why they are lacking on the E5.

I wish I had a good microphone so I could record output from both
speakers and measure the frequency ranges that these two radios
produce.

>>> Got my DX-302 today - MAN! Is this a receiver!<<<

They are nice but you have to drive them (spin lots of knobs) to get where you are going. Don't know why so many people run them down, think they either don't know how to drive them, got a lemon or have them confused with the DX300 which looked like a 302 but quite different. I used one for quite awhile with an AEA interface and an old Commodore computer to copy cw and ritty and it did very well. RM~

I guess I'm missing something here. If the impedance of a 1/2 wave
dipole at its resonant frequency is about 72 ohms, and at twice that
frequency is about 5000 ohms, how is any single balun going to work
for a multi-frequency listening or transmitting setup? How does the
popular 9-1 balun used by so many swl-ers work for multi frequency
listening? Would it be to simply get the impedance within yelling
distance of the receiver input, or is it really needed at all, given
the pretty good sensitivity of most modern receivers?

Who uses 1/2 wave dipoles for receive only?

9:1 baluns are for random wire monopoles.

The purpose of the dingus is to more properly mate the random wire
with the shielded transmission line. It keeps noise pickup down and
bleeds static electricity away from the receiver.

I went to Dayton last year; first time in about
5 years or so. Just a warning, if you've never
gone, Hara Arena's owners have never bothered
to improve the facilities since it opened, so the
bathrooms are less than desirable. Considering
that Hara Arena isn't the concert or convention
destination it once was (Hamfest excepted),
I suppose it's not a surprise.

Aside from that, the flea market is a treasure
trove of stuff. Don't believe anyone's spiel
that XXX is the only one of it's kind for sale
at Dayton; I found multiples of about everything
when I perused the market (including R-8B's).

If you're not a ham, a bunch of this stuff can
be blown over rather quickly; okay, that's a point
about flea markets anywhere, but I've gotten
my flea market persuing down to a science.
Make a list of what you'd like to look for, and
stick to it. Bring cash; although they do have
an ATM there, it's easy to go over your bank's
withdraw limit.

Hiya.... Our UTC's are the same :-) There was something VERY strong up on
6000. I didn't bother to ID what it was. Given the frequency and the
strength of the signal up on 6000 I ass-umed it was Cuba.

>DaviD declares - "Monica has a penis." <

It was pretty clear (to this reader anyway) that David was referring to the NEW president and his NEW "Monica," which in this case is an analog/pseudonym for the gay man that has spent many hours enjoying White House hospitality. The subtle or not-so-subtle implication is that GWB has been having relations with this gay man.

Just my $0.02 worth.

I like driving them, you have much more control & can work to dig out weak signals; the receivers I have that "do it for me" just doesn't do so well; case in point the Sangean ATS803A; good on the dipole but absolutely deaf on the whip; plus so real control over the signal like the 302! Same with the 394; excellent receiver off the external antenna, but lacking a preselector

Does anyone know what this weird religious chanting is on this
frequency? It sounds like several teenage girls reciting the Lords
Prayer over and over. right now there seems to be a man reciting and a
girl repeating after him.

It reminds me of something out of a "betrayed" type church.

I was looking for the Voice of Korea, but I don't believe this is it

???

I Am A Man...and nothing human is alien to me.

I agree that persecution of the Falun Gong and support of the Red Government over them is wrong and stupid, but this article, just as some of those David posts, is rife with subtle and overt mistakes that make it untrustworthy...a tiny example...

>Making matters worse, the folks at the Port of Humboldt Bay (near Oakland) want to let the Communists "build and manage a marine terminal" there.<

What geographical genius wrote this? Humboldt Bay is about 300+ miles north of Oakland. That's like saying Philadelphia and Portland, ME are next door.

The Port folks, if truth be known, are looking at this purely from a financial standpoint - the somewhat desperate North Counties are actively searching for new sources of largess, and this surely seems like a good revenue source. It isn't like the other governments in the U.S. never make business deals with the devil, right? I can think of an example right now involving the UAE.

As with most news reports of this type, the holes undermine the substance. In short, this slanted and inaccurate reporting is no better than the material David or anybody else posts here, and deserves about as much credence.

>I think we all know that Bush's Jack Twist is a Southern mayor he used to room with. Guckert is rumored to be Rove's butt buddy.<

I must confess, I did not know this. Scrutinizing the private affairs of individuals is not one of my hobbies, partly because these matters are largely immaterial to their ability to serve. There is plenty of other evidence, of a very public nature, that can be used to condemn a leader's competence...

http://www.chicagotribune.com/technology/chi-060301radioshield,1,6985...
<

Sounds good to me. I think the cell phone companies' argument of
illegality is ridiculous. A person has the right to not be annoyed by
cell phones, and if painting his establishment to attenuate those
signals is a way to achieve that, that is his right. I have no problem
with requiring the owner of the painted building to put up a sign
stating that the space is a no-call zone; it seems only fair to warn
people that their cell phones are no good inside.

At 1615 I'm getting the same type of repeated recitation stuff with a man saying something and then being repeated by what would seem to be a group of girls or children. However, the frequency is 11715, in Spanish.

It might be KJES Vado, NM but I show them in English at this time, however they might just have some Spanish. They're a religious outfit, and this is the same type of tuff that they broadcast in English, that is the repetitive speak, response, type of thing.

I look at it this way; there are plenty of older buildings
(or if you work in the basement floor) where cells
don't reach without repeaters. Hell, I've seen my
cell die in other odd places too. I doubt the cell
companies will be able to force the owners of those
buildings to install repeaters, so why bother with
people who don't want them accessed in their own
buildings?

Yep. Amazing thing is that the only real issue for these
countries is that their political clout would evaporate
if their oil wasn't needed. Those countries will need
to diversify if they want to survive with any sort of
real clout.

I had a 302 as well, and it wasn't a bad performer, once it was correctly aligned. And some of the home brew mods were removed. I've encountered a number of 302's and nearly all of them were out of alignment. Not that the 302 was a Drake equivalent, mind you, but it was not as godawful as the 300 that preceeded it.

It's a decent entry level radio, these days. And can usually be found at a price worth its value.

250. Power Supply interference to PC Monitor

Newsgroup: rec.radio.shortwave
Date: 2006-03-02 17:25:00 UTC
From: Verstaldin <damienmj@earthlink.net>
Message-ID: <MTFNf.1192$Bj7.294@newsread2.news.pas.earthlink.net>
Source record: 65690

I have my 17" monitor sitting on a plywood shelf. I have my communications scanner and shortwave receiver sitting very comfortably under the shelf. The Scanner does not have the power supply built in, but the shortwave receiver does, and the magnetic field of the transformer causes the lower right hand corner of the monitor to flicker until I flip a switch on the power tap to turn of the power to the receiver. I once tried lining the shelf with aluminum foil to see if I chould sheild the monitor from the receiver power supply that way, but to no avail. If I cut an empty 3lb coffee can and laid it out flat under the monitor and grounded it to an actual earth ground would that stop the interference ? TIA

Catholics would know <S> - they are reciting the Holy Rosary. It is one of the most ancient prayer forms of the Church, but other faiths have similar prayer forms.HOW the Holy Rosary is recited is another matter. Some groups get very elaborate with it. WEWN recites the Holy Rosary at times, and they have music in the background too. I am devoted to this prayer, but think the theatrics that some groups get involved in is a bit much. I prefer a purer, simpler mode.FWIW

I thought I was supposed to hear this being chanted:

Am A Man...and nothing human is alien to me.

The Earth is One Great Country, and humankind it's citizens.

Until lions have their historians, tales of the hunt shall always
glorify the hunter

Join the worlds greatest no-spin discussion forum in Cyberspace.

I've heard the Rosary chanting before. It's as mind numbing as Voice of
Korea.

Raymond Shaw is the kindest, bravest, warmest, most wonderful human
being I've ever known in my life.

You don't understand. We're not transmitting.

The goal in not some absolute effiency for raditating RF energy or babying
the RF final amplifier, but maximising the signal to noise ratio of the
signal fed into the receiver.

At low cost.

There's great improvment with these transformers because you can
stick some random hunk of hookup wire out in weeds, far enough away
from the computers, light dimmers and other modern electronic crap.

And if your receiver doesn't have high impedance input, you'll get
even more signal off a random wire, with either the transformer remotely
located or at the receiver.

With receivers, it's all relative.

Thanks for clarifying, but the question remains the same. Why would a
random length wire monopole at assorted listening frequencies always
be at nine times the impedance of the coax feed? If it is not, why the
fixed 9 to 1 ratio of the balun? Would not a variable device, such as
an L-circuit antenna tuner work better?

The device prevents the generator impedance from exceeding the load
impedance, which is a major no-no.

Rule of thumb is a high impedance source cannot be connected to a low
impedance input, but a low impedance source can be connected to a high
impedance input.

For maximum current transfer a perfect match is desired (like for
transmitting) but for receiving there's a little more latitude.

Agreed, the description of the programming content sounds like KJES fare.

Someone has posted up some *.mp3 files of some of these chanting sequences here:

http://shortwavemusic.blogspot.com/2005/08/three-from-kjes.html

I found it rather intriguing the first time I stumbled across those chants. I don't know anything about the religious affiliation of this station. For me, though, those chanting kids, coupled with the New Mexico ranch location, bring to mind the hippie commune scene from Easy Rider.

Of course it would, but that involves a lot of fiddling everytime one makes a
big frequency change whilst the balun approach offers a good compromise in
evening out the impedence mismatch, without the hassle.

I use an MFJ-986 tuner. Overkill for sure on a reciever, but you can
adjust the cap and inductor to "peak" any signal on any frequency (HF).
Easily possible to get 2 or 3 S units improvement. My current antenna
is 182 foot dipole, fed with 450 ohm ladderline. A 4:1 balun is in the

tuner.
I agree with Bob, a variable tuner will give greater results than just picking one particular frequency and balun.

Once you're above the AGC threshold ''S'' units don't matter. Signal
to noise is where it's at (bottles and cans, clap your hands).

No, and spinning it like thatmakes you look even more stupid.

I shouldn't do this, but I know you'll only make more dumbass fucking replies, so here it is. I point out that Ice Cube and the jewish-owned record company he worked for was spreading racist hate speech. Artemia Salina says that I am "deciding that [I am] the Master Race" because to faggots like Artemia Salina, pointing out racism by blacks is itself a racist act. (In other words, Artemia Salina junmped from one subject to another, which you were enough of a dumb motherfucker to accuse me of doing.) I didn't point out this irony because it wouldn't do any good, instead I pointed out that jews hold views of racial supremacy worse than any neo nazi. Here's the proof:

http://www.vdare.com/roberts/harvard_genocide.htm

You then talked about Jews
> thinking they are the chosen people and said "that is too comparable
> to Naziism". I know you are having a hard time seeing that those are
> not the same thing.

To stupid motherfuckers like yourself, as well as politically correct snivelers such as Artemis Salina, they aren't.

> people?

Whites were lynched all the time. You don't see many old pictures,
since books concerning lynching are put out by jewish publishing
companies with certain agendas, and they only talk about the black
victims. Kind of like how there were more white victims than black
victims of Katrina, yet the jewish controlled media only shows and
talks about the black victims.

> Even when white people were killed back then even for obvious
> madmen, there was a fair trial and a slightly dignified excecution.

Why are you such a liar?

Like Chief Moose and the beltway snipers.

Lots
> of white guys do horrible shit, but on the news, if anything like that
> happens, guess what? A Black guy did it.

You are one of the dumbest cunts on usenet and that is certainly saying
something. The jewish controlled news media never reports crimes
committed by blacks. Like this news story for instance:

http://www.nypost.com/news/regionalnews/64445.htm

I never heard the New York Times, USA Today, NBC, CBS or ABC talk about it. Yet, NBC, CBS, ABC, the New York Times, the LA Times and every other newspaper with wide circulation can't stop talking about Emmitt Till.

The fact is that anti-white hate crimes committed by blacks never get reported by the jewish controlled media. And whenever there's a hate crime committed by whites, it makes front page news. Even though this proves that most hate crimes are committed by blacks:

http://www.worldnetdaily.com/news/article.asp?ARTICLE_ID=48898

In fact, I never see NBC, CBS, ABC or jewish owned newspapers talking about black criminals, period. Whenever a nigger commits a crime, they never show a picture of the criminal and never mention race. Yet they plastered Scott Peterson all over the news.

> And white people get away with
> it, too!

Is OJ white?

> Police are just waiting for a young Black male to fuck up and
> don't even give a shit when a white guy makes meth in his living room!

Curiously, the real aryans tend to be a bit more swarthy
than Hitler and his faithful flock of leather-encrusted
baldies imagined them. Only centuries and centuries of
cousins marrying could have mutated their proud lineage into
anything like the Prussian Blues.

Lookie here, Sweetheart. The only things I'm addicted to are
endorphins and caffeine. I had, long ago, an undiagnosed mental
anomaly for which I foolishly self-medicated but that was another
lifetime.

You, on the other hand, are afflicted with something way more
sinister.

Actually, it's a pretty good article, and makes the oil-producing nations look like a bunch of scared crybabies - which they are, and for good reason. The major Bush quote in it is right-on-the-money, assuming he means what he says. He wants to cut them out of the energy equation in the interests of the nation and world, rendering them obsolete and powerless - a very good thing. Obvioulsy, this isn't the whole story and some details are yet to be ground out like the sausages we should never see manufactured, but it's a good start. You might want to read it before pronouncing the messenger incompetent.

You're not the only one taking that position. There is growing distaste for IBOC among listeners who find the AM system objectionable precisely for it's noise. Secondarily, some hearing the AM system in all of its digital glory, liken it to internet streaming...full of audible artifacts, most of them objectionable. Occasionally, it sounds pretty good. But that's not always the case. Depending on reception conditions and the general state of station's engineering.

This is nothing new, of course. What is, is that listeners are starting to speak out about it. Salem, at least here, is listening, and has turned off their IBOC generators not only to curb local QRM, but to protect listeners of their own signal in Milwaukee, who were having more than a little difficulty receiving the local due to the QRM from Chicago's signal.

About ten years ago I was in Little Rock,Arkansas and I decided to take in the Arkansas State Fair one night.It wasen't long and I had to visit one of them mens restrooms (facilities) I stepped through the door and there was a red headed woman in there,sitting on one of them facilities between two guys who were also sitting on the facilities,she was the only woman in the mens facilities.She said,Somebody dared her to do it.(it didn't bother me at all,I thought nothing of it) There is a Krystal fast food eat joint just across Highway 80 from me.Back in the 1970's,there used to be sort of a runnin joke that the pay telephone was in the mens restroom.

Lisa,
I have been reading about your deal with the DX-302. If you like it,
then by all means get it and enjoy it! I am back again into old, and
I mean old, SW radios. Just picked up 2 Hallicrafters S-38's and am
restoring them, and trying to get an S-40. All of these radios are
tube"boatanchors" but I am no longer into "hunting DX" but rather
enjoy the warmth of the old-fashioned design and trying to snag
whatever I can on them. Enjoy your radio!

The Dark Side of China's Rise

China's economic boom has dazzled investors and captivated the world. But beyond the new high-rises and churning factories lie rampant corruption, vast waste, and an elite with little interest in making things better. Forget political reform. China's future will be decay, not democracy.

MUST READ http://www.foreignpolicy.com/story/cms.php?story_id=3373&print=1

Drug cartels "laundering cash in China"

...ever more sophisticated drug-trafficking cartels were using China's inadequately controlled financial system to launder their proceeds, possibly even getting tax breaks in the process.
...
"institutional obstacles and rivalries between financial and law enforcement authorities continue to hamper Chinese anti-money laundering work and other financial law enforcement".

It cited a recent estimate by the International Monetary Fund that money-laundering in China may total $24,000,000,000 each year. "Proceeds of tax evasion, recycled through offshore companies, often return [to China] disguised as foreign investment, and, as such, receive tax benefits," the report stated. It accused Hong Kong-registered companies of playing a key role in transferring corruption proceeds and tax evasion recycling schemes.

'Chinese Putin' gets tough on Internet's 'dangerous ideas'

Political sources in Beijing said President Hu Jintao, also CCP general secretary, told his aides in a recent internal meeting that security and propaganda departments must do a more thorough job in exterminating "heresies and dangerous ideas [from the West]." [and replace them with their own heresies and dangerous ideas: i.e. Dr. DaviD.]

"We must redouble efforts to counter attempts [by the West] to infiltrate China and wreak havoc on the political and moral standards of party members and intellectuals," Hu said. "We must counter attempts by hostile forces in the West to transform China into a capitalist country via a process of peaceful evolution."

The party chief gave instructions to security and propaganda cadres to "pay more attention to, get rid of, and impose tighter control over" politically incorrect elements in the media, particularly the Internet.

...
What is even more significant is Hu's idea about "expanding the propaganda base," that is, increasing the number of papers, journals and websites [radio & TV propaganda broadcasts to the West] that are deemed patriotic and ideologically above board.
...
As usual, the CCP leadership has sought to divert the attention of the disgruntled public by playing up the bogey of the U.S. trying to introduce multi-party, parliamentary politics to China.

In the annual Provincial People's Congress held in late February in Guangzhou, capital of the rich southern Guangdong Province, senior local police officers claimed that recent confrontations between peasants and authorities in several villages resulted from "infiltration and instigation" by hostile forces outside of China. [echoes of Tiananmen Sq.]

that's funny; I am also trying to get into the old tube radios. Turns out I was destined to get into SWL; as a 2 month old baby, my parents were building their own house in the hills of Vermont. It was in the middle of one of those freaking cold snowy winters Vermont used to get. My Mother used to listen to a tall, wooden, tube type SW receiver all the time. The house caught fire & burned to below ground (I caught pneumonia according to my Ma). She hasn't listened to SW since, mainly because she couldn't afford another receiver, and of course she's not "into computers" now & has no idea of things like ebay, etc. I just sent her up a portable receiver & a copy of Monitoring Times. I am watching/bidding on a couple old wooden tube type receivers on ebay in the hopes of "winning" one for not too much, getting it fixed to back to working condition, & brining it up to her; sort of a trip down memory lane/Mother's Day gift.

BTW, does anyone have an S-40 for sale in restored shape? I am in the process of cleaning and restoring my S-38 B and C model, which I just picked up this weekend. What goodwill store are you finding all of these gems?

Well, had anyone bothered to actually read the WSJ article I referenced, they would have discovered that "listener distaste", listeners "speaking out" and a discussion of "objectionable noise" were the main points of the article.

However, in true "ace-wipe" fashion, he yet again fell into the trap that Mr.Jensen pointed out just today:

Rampant corruption? Do you mean like Halliburton, WorldCom, Adelphia, Health South, Qwest, Tyco, Enron, etc, etc. (is that rampant enough???)

Vast waste? the world's biggest fleet of gas sucking SUV barges? More food thrown out in a month than some Third World countries use in a year? You mean that kind of vast waste?

An elite with little interest in making things better? Dare we talk about our lower life expectancy and higher infant mortality rates than other countries, the number of people having to count on food banks up 9%, fewer people having health care coverage every year...

Be careful there, SeeingEyePUp, you might just be describing some other countries in addition to China and opening a can of worms you may not want to open...

The difference could be the speakers in the two units. How do they sound
with earphones? You could use the same earphones on both radios. I know
that the Sony 7600G sounds better on earphones.

> for a multi-frequency listening or transmitting setup?

An antenna, any antenna has a characteristic impedance as a result of its physical construction. This characteristic impedance is independent of frequency and reactance to a certain frequency.

For a single wire Marconi antenna the wire diameter and the height of the wire above ground determine the characteristic impedance of the wire. This impedance needs to be transformed to the coax 50 ohm impedance. This antenna, UNUN and coax antenna system is frequency independent from the impedance standpoint.

Depending on the length of the wire the reactance of it will change over frequency with a number of wavelength dependent conditions over the SW spectrum. The UNUN or BALUN does not address this change in reactance over frequency.

The dipole is the same story but different characteristic impedance somewhere in the 72 to 50 ohm range depending again on height above ground so a 1:1 would be best. Barring noise problems a transformer or choke for the dipole meant for listening would not be a help.

> How does the popular 9-1 balun used by so many swl-ers work for multi
> frequency listening?

The typical wires size chosen and the typical height above ground causes most random and long wires to be in the 300 to 600 ohm range so the 9:1 ratio is not a bad fit.

> Would it be to simply get the impedance within yelling distance of
> the receiver input, or is it really needed at all, given the pretty
> good sensitivity of most modern receivers?

Yes to the first part and yes to the second part. Why waste received signal energy from the antenna? A very weak signal at the antenna may not be heard at all on the radio without the transformer.

A tuner addresses the reactance of the wire and not its its output impedance. The tuner can cause the wire to be resonant at some frequency. Yes, the output impedance changes as you adjust the tuner but you are not attempting reach some impedance value, you are trying to reach a resonant condition.

You need to use a ferromagnetic shielding material like steel or iron.

The transformer is probably on one side of the radio. Switch positions
of the units so it is farther away from the monitor.

I have the same 989 tuner with a ladderline fed dipole for 80-10 meters; also, a smaller Heathkit tuner for an end-fed wire on 20 meters. Certainly, they can make a difference in how loud a signal is, but as others have mentioned, you do have to twist a few knobs. I don't mind, but I can see how some might.

(I also like a manual shift car; automatics are for wuss's)

Univision doesn't own a 540 station about 100 miles from the 560
transmitter. Salem does.

(I'm not sure exactly where the 560 transmitter is, but when I lived in
Milwaukee it sure had a great signal up there!)

From: Charly <no.spam@no.email>
Message-ID: <44081cae$0$8982$626a54ce@news.free.fr>
Source record: 65542

Dear all,

I have, from an old bunch of computer wires in the disposal place of my office, some ferrite cores such as the ones described here : http://www.tdk.com.tw/ctl_pdf/ctl_1.1.pdf

I have two with the following spec : ZCAT2032-0930

I can possibly use one on the feed line to the radio to reduce some noise, but, can this kind of material be used for building a balun/unun ? It is a tube of ferrite instead of a toroid, so the windings might be a bit different...

Any hints out there ???

Thanks for your inputs,

Charly

Hello, David. Good to see you again. But to refine the point....WIND had turned off the IBOC signal some considerable time after the acquisition. And while Univision Radio was very happy with the HD system, listeners of several stations, especially up here in Lake County, were not. It was when the IBOC splatter objectionably intefered with a co-owned signal in Milwaukee that they pulled the IBOC system.

IBOC doesn't just create objectionable interference for out of market, or deep fringe listeners. Not every signal in this area has uniform coverage in its ADI, and where signal levels flag, IBOC creates quite the obstacle to quality listening.

> the article.

Actually, I did read the article, Carter. I was in the act of posting
something about it, myself, when I read your comments.

My point was not just that there's now obvious and ongoing objection
to IBOC's noise, but that listener objection has begun to have an
impact, and at least one not insignificant company has changed it's IBOC
strategy as a result. WSJ hasn't addressed that point.

This underscores the fact that despite the enormous investment, and
the closed nature of the IBOC ownership through iBiquity by companies
widely believed to be intractable, change can be, and has been effected
by looking at local interference.

It can be done. It has been done. At least on a small scale. Perhaps
if more listeners voiced their objections....More likely they'd be

pissing in the wind.

The ongoing thinking is that radio is essentially local, and that beyond a city-grade contour there is no need for concern about either interference, or listener interest. From a pure business model, this is pretty rational thinking. So, IBOC's limited reach and widespread noise are not really practical issues for broadcasters, because surveyable, revenue influencing listeners, it is believed for most practical purposes, do not exist outside of the city grade contour. And in many cases, that's true. But in huge megalopolitan areas like Chicago/Milwaukee, there are a significant number of local signals that do not blanket the market with uniform city grade strength, leaving some blocks of listeners in less desireable, and already noisy listening conditions. And out of luck. Here in Chicago, there are several major signals that don't have the kind of blanket coverage that WGN enjoys. From my location in Lake County, as well as my apartment downtown, there are times I even have trouble receiving even WLS clearly, due to low signal strength and just local electrical noise, and I have quite the reception infrastructure. Real Oldies at 1690, is a tough catch north of Cook County, day or night, even without IBOC interference, as well. WIND is also a tough catch sometimes. But most signals could at least be listenable, and relatively quiet, before IBOC. Caught here halfway between Milwaukee and Chicago (but still within Chicago's ADI), much of what I get is fringe listening on AM from either city, as with the rest of the people living between Libertyville and South Milwaukee. IBOC has made AM difficult at times for a substantial, and measurable, audience in both ADI's.

And other, larger areas of population will display this interference problem for many otherwise listenable, and local, signals, as pointed out in the WSJ article. Especially smaller, but profitable, niche format radio stations, are getting chewed up with IBOC noise. Even on their home, revenue producing turf. So, while IBOC does create problems for listeners trying to hear Imus from an out of market signal, and complaints are made, they're largely ignored, due to the limited sales area/limited range IBOC, and, for that matter, broadcast mentality. However, there are local ADI regions where IBOC interference is of concern to in-market listeners. And as more IBOC systems are deployed, this will only get worse. Finally, these listeners are making complaints, as the WSJ article points out. My point is that they're finally being heard, and may have impact on some IBOC deployment.

The underlying point would then be, for those experiencing IBOC interference with a local signal, to make some noise of one's own. Because, if a complaint is going to be heard, it will be on the grounds of local interference.

I'm sure David Eduardo will disagree. But that's ok. He and I have disagreed on a number of points.

But that's his job. He's a consultant. :)

369. (OT) Ports? a good idea...

Newsgroup: rec.radio.shortwave
Date: 2006-03-03 13:56:52 UTC
From: Oklahoma Joe <ok-no-spam@okie.net>
Message-ID: <44084B1F.4D3B194E@okie.net>
Source record: 65908

With all the controversy over the United Arab Emirates company approved to run port operations, one man with a lot of experience and expertise in the area says it really doesn't matter who gets the contract ï¿½ though he is sure it should be an American company.

Robert Pfriender, president of Allied International Development, says everyone is really missing the point on port security.

"The real concern," he tells Joseph Farah's G2 Bulletin, "is that if a weapon of mass destruction arrives at one of mainland ports, it will be much too late for any possible security measure to have any effect."

A 12-kiloton nuclear device (small by today's standards, and similar in size to that used on Japan) detonated at the Brooklyn Redhook Terminal would likely kill 2 million people or more as the radioactive fallout rains downwind on the completely unprotected citizens of Long Island, his company estimates.

"Such an event which is unfortunately entirely plausible at the current time would change the nature of our free society in profoundly negative ways and would likely ruin the national economy aside from the great human tragedy of immeasurable proportions," he adds.

And that's why Allied International Development put together a comprehensive plan for Customs and Border Protection to develop three offshore cargo container security inspection ports to inspect each and every container prior to it being cleared for entry to the U.S. mainland. The ports would be located 25 miles offshore to mitigate the effects of a detonation and so any fallout (which is minimal over water) would not pass over land.

"We offered to develop these ports with private financing and at no cost to the government," he said. "The operation of the ports would generate revenue from a small inspection fee for each container. The fully automated robotic process would add only a slight delay to the container delivery time."

Not only did Pfriender ensure the proposal was seen by Customs officials as far back as August 2002, less than a year after the Sept. 11 attacks, he also took the time to see that virtually every member of Congress received this proposal ï¿½ along with officials in the White House, the Department of Defense, the Coast Guard and the Department of Homeland Security.

Interestingly, the only response he received from Customs was a letter signed by Jason Ahern, the administration's point man on pushing the UAE deal through.

"Obviously, Mr. Ahern and his superiors have either no idea of what security should be or they purposely choose to not implement a security protocol that will prevent the demise of our country," says Pfriender. "This is now the same department [Homeland Security] that dropped the ball on Katrina relief and has 11,000 mobile homes sitting unused in mud, has left our borders completely unsecured, fail to provide fallout shelters to our citizens despite serious nuclear threats, have reversed their policy on allowing sharp and dangerous items on airliners, have never implemented any screening of checked airline luggage or freight and the list just goes on and on."

Pfriender says Customs chooses to rely on the "Container Security Initiative," which is a virtual (as opposed to a reliable physical) "inspection" of containers. In reality, less than 4 percent of containers are targeted for this "inspection" which is really only a screening, with less than 1 percent of the 4 percent of containers which are screened being actually inspected.

Further, these "inspections" are carried out by foreigners at foreign ports and Customs can only rely upon the honesty of the foreign inspectors. Worse, there are only a few dozen ports enrolled in this program out of thousands of ports worldwide. None of these ports are located in countries which are the most serious threats to U.S. national security.

>You haven't shown what exactly is slanted or inaccurate. The facts speak for themselves. <

They are what they are - assuming the reporter is accurate, which is questionable anyway - but the problem is when someone tries to derive additional speculative information from them - which is the point of your posting this.

>The Andromeda galaxy is quite near. The word "near" is relative. <

Fine - as far as it goes - but if someone tries to imply an additional point that the galaxy somehow poses an important problem for us a result, the argument collapses. That's the slanted part.

EEB owner sentenced for fraud: The Fairfax Journal reports that the
owner of the now-defunct Electronic Equipment Bank in Vienna,
Virginia, Richard F. Robinson, K4EIH, has been sentenced to four
months in jail and four months home detention for fraud. The Journal
report by Ellen Sorokin says that Robinson, 68, pleaded guilty last
December for conspiring to submit false invoices to the Drug
Enforcement Administration in 1995. Robinson also was ordered by US
District Court Judge Leonie M. Brinkema to pay $52,100 in fines and
restitution. Robinson pleaded guilty in December to one count of
conspiracy to submit false invoices to the DEA in August 1995. The
sentencing was February 19. Federal authorities say in documents filed
in US District Court that Robinson conspired with Robert Burchell, a
telecommunications specialist at the DEA's Northern Virginia
headquarters. Court documents say Robinson was indicted on charges he

submitted two bogus invoices to the federal agency totaling $50,000 for batteries used in DEA radios, but the batteries never were delivered. Robinson received payment for the nonexistent batteries and kept an estimated $12,000 for his efforts, authorities said in the court documents, but Burchell instructed him to pay the rest of the money to third parties. Authorities said the third-party payments actually were for Burchell's personal benefit. Burchell was sentenced to four years in prison last October

This recording from OPEC has been played before. We threatened to open up oil exploration and become less dependent on the world oil market in the 1980's and in the 1970's. Each time OPEC counseled us to not go too far or they would crank the spigots down. So we talk a lot about becoming independent of the world oil market, but the reality is there is only so much we can do. Think about it from the perspective of those oil producing countries. For many of them oil is their only product and one of their larger buyers is threatening to go it alone. I suspect we would become a bit retaliatory in a similar situation. And demand from China, India and other growing asian countries will keep upward pressure on prices for the forseeable future.

Even if you get the core off the shelf, you still need ot wind the
coil.

Any home-brew coil should be frequency swept. The parasitic capacitance
can really limit the performance.

Local or distant interference?

If it's local, some switching power supplies use a "spread spectrum"
oscillator to get around the interference regulations. This allows
stuff to put an acceptable display on the testing lab's spectrum
analyzer, but the damn crap is still radiating more energy than
it should. One of those letter of the law vs. spirit of the law
things.

My HP all in one printer/scanner does that.

Distant inteference, try around 12.100 (or 4.9 MHz) and see if it's the
same thing, It could be CODAR, some sort of over the horizon radar used
to measure wave heights.

How does the IBOC power allocation work? Does the analog channel retain
it's original power with the IBOC channels added on or is the station's
total power output (analog + IBOC) held to the originally licensed limit?

Thanks for the link. That article is better than the usual press release rewrite other tech "journalists" put out.

As usual in the murky world of the upcoming New Digital AM Revolution, many points bring up unanswered questions. Such as:

"Digital radio is touted as broadcast radio's golden ticket, a technology that allows broadcasters to squeeze more stations into frequencies that currently hold just one."

The article is about IBOC-AM. As far as I know, Ibiquity hasn't said anything about multicasting on IBOC-AM, but it seems to me that it's multicasting's extra channels which have the potential to bring in extra revenue and the touted better sound of digital modulation is actually a side issue.

"Advocates say the technology will allow radio to better compete with niche-oriented products like Internet radio and with other entertainment technologies, like iPods."

I suppose a corporation could get pretty nichey with enough channels. But it's still broadcasting. They'll have a tough time competing for listeners who want to pick the audio and the time it's played. And even if Clear Channel can triple the number of channels they have, I doubt they will get so eclectic as to play the great Thurman Valentine's "Hello, Louise, are you a lesbian?".

"AM stations can improve the situation by going digital themselves."

The "situation" is the interference situation. I'm not sure how that would work. By going digital, I'd assume listeners in fringe areas would have their digital radios autoswitching from one station to another as the signal level changed. That's assuming there's a number of listeners with digital receivers.

The K7RA Solar Update

SEATTLE, WA, Mar 3, 2006--Low activity continues with another string of zero-sunspot days. Average daily sunspot numbers for this week were down by 4 points from the prior week to 3.1. Average solar flux declined by 1 point to 76.4.

February has ended, so a comparison of monthly averages of daily sunspot numbers and solar flux is in order. The average sunspot numbers plummeted in February--far below any other month in the second half of Cycle 23.

The average daily sunspot numbers for the months January 2005 through February 2006 were 52, 45.4, 41, 41.5, 65.4, 59.8, 68.7, 65.6, 39.2, 13, 32.2, 62.6, 26.7 and 5.3. Average daily solar flux for the same months was 102.3, 97.2, 89.9, 85.9, 99.5, 93.7, 96.5, 92.4, 91.9, 76.6, 86.3, 90.8, 83.4 and 76.5.

This weekend is the ARRL International DX Contest (SSB). Although solar activity is low, geomagnetic conditions should remain quiet, which is good. Sunday, March 5, could see some unsettled activity. The predicted planetary A index for March 3-7 is 8, 5, 12, 5 and 5. Sunspot and solar flux levels should stay about the same, which is very low.

Geophysical Institute Prague predicts quiet conditions on March 3, 4, 6, 7 and 8. Quiet to unsettled conditions are forecast for March 5 and 9.

ARRL member Jake Groenhof, N0LX, of Golden, Colorado, sent an interesting and amusing e-mail titled "Solar Minimum Hoax." He mentioned all the fun he's been having as we slide toward the end of Cycle 23, working hams around the world from his backpack pedestrian mobile QRP rig. He
writes:

"This will be my first solar minimum as an active ham. To top it off, I've operated almost 100%
QRP (sideband) for the past four years, and I'm beginning to think this solar minimum stuff is all
a hoax. How else could you explain this past weekend?

"I was up on a hilltop near the home QTH in Colorado running five watts from a backpack-mounted radio on 17 meters. My second contact was Hawaii. Then, a few QSOs later
I was talking to Yuu, JH1OCC, in Japan. A half-hour later I received a 57 signal report from Hiro,

JE7JIS.

"The East Coast was well represented from New York to Florida, and a MD station recorded
one of my transmissions and sent it to me in an e-mail. The recording is on my Web site.

"The weird thing was the complete lack of W6 calls. Not a single California station to be heard in
four hours. Maybe it's not a hoax. It's a conspiracy!"

Jake uses some impressive antennas for his backpack rig, and I'll bet he is careful about
walking near power lines. In fact, all of his photos show him standing out in the wide open
spaces of Colorado. Check it out! Not to be missed is the photo of Jake standing in a snowstorm
using an antenna suspended from a balloon! Very impressive. Thanks, Jake, for sharing the
audio recording and these extraordinary photos with us!

For more information concerning propagation and an explanation of the numbers used in this
bulletin see the ARRL Technical Information Service Propagation page. An archive of past
bulletins is on the ARRL Web site.

Sunspot numbers for February 23 through March 1 were 0, 0, 0, 0, 11, 11 and 0, with a mean of
3.1. 10.7 cm flux was 75.1, 76, 76, 76.5, 77, 77.1, and 77, with a mean of 76.4. Estimated
planetary A indices were 3, 6, 1, 5, 3, 5 and 7, with a mean of 4.3. Estimated mid-latitude A
indices were 4, 4, 1, 3, 2, 2 and 5, with a mean of 3.

Yes, but the Bush administration has generously established a 1.5 Billion Dollar converter box entitlement program to ensure every underprivleged TV American may continue to watch the election time blizzard of campaign commercials.

I sure hope our good friends in commie China will extend us the 1.5 Billion so we can get the much needed converter boxes without having to pay for them anytime soon.

Before you guys get too invloved in roll'em yourself toroids you should know that amoung about 7 USA manuafactures there are probably 40 different ferrite mixtures for different uses with permiabilities ranging from about u=5 to about u=3500. and optimized from frequencies from 60 hz ac line to gigahertz UHF. You usually cannot tell one from the other by eyeball or even part number. Take a look here

http://www.amidoncorp.com/aai_ferritecores.htm

Building wire is good! The antennas here are made from #10. Found a very large full spool of it along
the road here a few years back. The spool is 13 1/2" diameter and 10 1/2 high.

Not that big an issue actually since most of us are (or will be) on
cable tv by then. Your analog tv will work just as well on cable the
day after analog signals disappears.

It is a separate digital signal riding along on the analog signal. Separate
power.

Be careful? Opening a can of worms? You obviously have never lived in
China - bwaHAHAHaHaHahahaha...

According to the World Bank, the carelessness of the Chinese economy with
regard to the environment has brought about profound damages, which could
cost the country around 8 to 10% of the annual GDP in medical expenses to
treat sick people, in damage to agriculture and to marine fauna. More than
60% of China's waters have been poisoned by toxic liquids, industrial waste,
and chemical substances. Water shortage and climatic changes
[desertification] have proved fatal to agriculture in many areas of the
country, destroyed by floods or drought. The state has enacted
anti-pollution laws but the push for economic growth, the use of coal to
meet energy needs and the negligence (or connivance) of local governments,
have turned pollution into a national and international problem: Korea,
Japan and the United States have lamented the fact that toxic clouds
produced in China have reached and polluted their skies too.

China's development model has proved to be inefficient, requiring enormous
quantities of raw materials and masses of forced labor to exist. Alongside a
GDP growth rate of little more than 9% [if you believe their government
statistics], energy consumption in the past two years (2004 and 2005) has
risen by 16%. China's oil imports in 2004 grew by 35% over the previous

year, while in 2003, the increase was of 31.2%. The comparison with the economic growth rate leaves one speechless: in 2004, the increase of oil imports was of 369% the growth of the GDP!!! Experts estimate that for every GDP point, the quantity of energy spent by China is three times that of the United States and nine times that of Japan.
...
Chinese experts are worried about prospects for the use of resources: if China presses ahead with its current model of development, it risks exhausting or monopolizing global oil and mineral reserves within a short time.
...
Up to the present day, China's cities, the heart of economic development, represent an image of the third world: a modern, elegant center and abandoned and poor suburbs. Some experts say even Beijing, the capital, could compare to a "European capital", surrounded by "African rural areas", with migrant workers who barely scrape together an annual income of 668 yuan (around 67 euros).
...
The main problem remains the corruption and avidity of village leaders and party secretaries, who use the instrument of taxation and expropriate taxes to enhance their own personal economic might.
...
The weakest link in China's development is the role of the law, which appears to be [IS] subject to the CCP. In rural areas, elections for village heads, and even for party secretaries, are held, but candidates are selected from the top [appointed by the Beijing Cadre] and once elected, they cannot be removed. NPC representatives are also co-opted by the CCP. To make their voice heard, the population has only one means: petitions. But even this route is becoming ever more restricted. These days, in the lead-up to the NPC, thousands of people who went to Beijing to present their petitions to delegates were dragged far away from the city [they are usually beaten and sent to jail]. At least 12,000 policemen are patrolling the streets to prevent assemblies and demonstrations.

According to Jerome Cohen of New York University's Law School, China's legal system is too weak and does not allow citizens, especially peasants, to make their voice heard. To the present day, hundreds of thousands of people turn to the courts for justice, but only a tiny percentage are heard. Prof. Cohen, who is currently in Shanghai, said although there are many law projects, their implementation is reined in by the Party leadership's fear of seeing its power erode all the more.

Be careful? Opening a can of worms? You obviously have never lived in China - bwaHAHAHaHaHahahaha...

There are preliminary talks with China to that affect. The talk on the
street is that the free converters can only tune in China Central TV (CCTV)
programs.

They usually put in a good signal. That transmitter site, by the way, is in
Moldova, not Russia.

You might want to compare signals at 0200 when Voice of Russia uses 7180 from
the same site.

The Moldova site transmitters are 1000 kW capable.

What an amazing coincidence. Keyboarding and up-arrowing my way up the dial, I stumbled upon that station about fifteen seconds BEFORE I read your post. That station is coming in loud and clear in northern Virginia on a RS DX-398 using the whip antenna.

I think it comes from the same place that 73 comes from, an old telegraph code (Philips telegraph code?). The code is a two digit number. Don't know what it means though.

Generally, all you say above is quite true and I agree with you. A
profound lack of (enforceable) environmental laws is one of the reasons
our greedy corporate whores like to do business in China.

> Up to the present day, China's cities, the heart of economic development,
> represent an image of the third world: a modern, elegant center and
> abandoned and poor suburbs. Some experts say even Beijing, the capital,
> could compare to a "European capital", surrounded by "African rural areas",
> with migrant workers who barely scrape together an annual income of 668 yuan
> (around 67 euros).

Ah, unbelievably cheap wages. Congratulations! You've just found the
other reason the greedy corporate whores like to do business in China.

[As a side note, Bunnypants, while in India, giving them nukes, today
stated yet again that "Outsourcing is *good* for this country" ...and he
wouldn't lie to us, would he?]

Although what you say about China is mostly true, it's not the only
country that suffers from those ills. As I pointed out above, it seems
like there is enough waste and greed to go around and I'm afraid you
don't have to look all the way to China to see it.

As an interesting bit of speculation, maybe, just maybe, you might even
be able to make the case that if there wasn't so much greed here, we
might not have gone into China so heavily, and thus not exacerbated the
Chinese problems you so eloquently outlined above.

I had the AGC on fast, so I don't think that was the problem. I tried lsb and usb, moving back and forth. I even tried AM. I never had a situation where I couldn't park the VFO and get clear sideband from a reasonably strong signal.

Any idea who would be using that frequency?

Actually, it's very good wire.

''As a young boy chasing dragons with your wooden sword so mighty
You're St. George or you're David and you always killed the beast
Times change very quickly and you had to grow up early
A house in smoking ruins and the bodies at your feet

You'll die as you lived in a flash of the blade
In a corner forgotten by no-one
You lived for touch, for the feel of the steel
One man and his honour
The smell of resined leather, the steely iron mask
As you cut and thrust and parried at the fencing master's call
He taught you all he ever knew, to fear no mortal man
And now you'll wreak your vengeance in the screams of evil men

You'll die as you lived in a flash of the blade
In a corner forgotten by no-one
You lived for touch, for the feel of the steel
One man and his honour
(2:02-Instrumental)

Die as you lived in a flash of the blade
In a corner forgotten by no-one
You lived for touch, for the feel of the steel
One man and his honour''

I was intrigued by your question - Googling finds an article "TELEGRAPHIC CODES OF MORSE AND MEN by Kenneth Brown G0PSW" in which he says "The U.S. 1908 Dodge's Manual gives today's definition of 73 as "best regards". Other Dodge numbers were 88 (love and kisses), 55 (lots of success), and 99 (get lost, which was probably unofficial)."

http://www.qsl.net/w5www/73.html#73
http://www.ac6v.com/73.htm

The use of 73 and 99 together seems rather ambivalent!

Tom

Greetings! Where do you find your S-38s? Ebay I would guess. I have been wanting to get a S-38D as I believe it was made circa 1954, the year of my birth. I have always loved the glow of tube radios. Somehow I managed to let all my tube shortwave radios slip away and am down to MW and 11 meter tube radios. Where is the best place to get an S-38 on the cheap? Have a great weekend! Jon in South Carolina.

It sounded like I was getting a high pitch and low pitch voice a the
same time, so I just couldn't find a sweet spot to park the VFO.
However, I'd look for a simpler explation first before going the route
of frequency inversion. I'll keep an ear out for activity there.

Does anybody have any information about the following Chinese military HF receivers: 229-HF and 339-HF? Apparently they were made in the 1970's.

Are they solid-state or tubes?

Performance? Specification?

I have opportunity to buy one of these receivers but I would like to know more about them before confirming the purchase.

Regards.

I bought my good working and in excellent physical and cosmetic Hallicrafters Scondition for about three or four dollars Hallicrafters S-38 EB Radio at the Goodwill thrift store that used to on Palmyra Street in beautifull down town Jackson (www.google.com Cool Buildings of Jackson) a bunch of years ago.

Yerra,and I also bought (for fourteen dollars) my Telefunken/Grundig (I believe Telefunken built that Radio,I am almost certain of that too) 1950's (1957,something in one of the two little owners operators manuals/booklets says 1957) wooden cabinet floor model (in very good physical and cosmetic condition,it's a Beauty!) AM/FM/Shortwave/Phonograph Radio and my 1950's (it might be an early 1960's) wooden cabinet table model Telefunken Opus 7 AM/FM/Shortwave Radio (in almost like new physical and cosmetic condition,it's a Beauty!) for about four dollars at the same Goodwill thrift store.

My Radios are NOT for sale for love or money,I will Never get rid of them or any of my thousands of other old thingys for as long as I live and I think I own about three hundred old Radios,at least.Some people sneer at other people who like to shop at thrift stores.HUMPH!,,, let them sneer,,, little do they know! One thing is for Certain,my old things will Never see the light of ebay,not as long as I live and I can do anything about it.

I am not sure about these but I know I checked ebay and found both of them. Really, in my opinion for the price you would be paying you could probably get a good older Icom, Kenwood or Yaesu rig. Even the IC-75 would be a good pickup and just for a couple hundred more than what you would be paying. Because both of them are anywhere from 230 to 290 dollars plus 79 for shipping. Which makes your total 309 or 359.

For that price you can buy an IC-R70, R71, IC 75, Yaesu FRG-100 or something newere and probably better. I would say for this age of a radio that the performance is vastly superior on the newer stuff. A Barlow Wadley versus the radios of the late 80s, 90s and today would be even probably be somewhat inferior. Considering how much noise reduction, sensitivity, etc you get from a newer receiver. Just my two cents.

483. Heavy Duty -vice- Quality Antenna Wire = Size -v- Durability

Newsgroup: rec.radio.shortwave
Date: 2006-03-04 08:46:48 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1141462008.234517.36500@t39g2000cwt.googlegroups.com>
Source record: 65823

David - I will See-your-19-Strands with 41-Strands
and Raise-you-168-Strands more :o) ~ RHF

The two Antenna Wires that I like are :
[Heavy Duty is 'ok' - but Strong-and-Durable is Better]
* Quality Over Quantity (Size)

"QuietFlex" Antenna Wire by Antennas & More:
Insulated, Strong, Flexible and Durable
http://www.antennasmore.com/wire&.htm
"QuietFlex" #14 AWG Wire has more than 41 Strands tightly twisted
together under its Flexible Insulation making it both Strong,
Flexible and Durable.

"Flex-Weave" Antenna Wire
http://www.radio-ware.com/products/fw.htm
"Flex-Weave" is a hybrid aerial wire that consists of 168 strands
of woven #36 solid copper wires that provide high strength and
extreme flexibility. The most popular version of "Flex-Weave"
is the 'equivalent' of #14 AWG wire size. It can be 'used' for
unsupported spans up to 200 ft (100-150 ft in areas with high ice
and wind loading).

* FLEXWEAVE 14 AWG with extra tough Black Polyethylene jacket.
168 strand copper ultra-flexible antenna wire.
Break strength 149 lbs.

NOTE - This same type of THHN THWN Machine Tool Wire
High-Temp Oil&Grease Resistant in AWG Size # 14 is a
reasonabily good Antenna Wire for most home-made
Antennas used by SHortwave Listeners (SWL).

Question ? WHY ? Use Size # 8 Wire when the smaller size
14 Wire of the same type of Wire will get the job done at a
lessor cost and just may stay-in-the-air longer ?
{ Beter Value -and- Better Performance }

hope this helps - iane ~ RHF

United for Peace and Justice

Co-chaired by committed Socialist and longtime activist Leslie Cagan

UFPJ was officially created on October 25, 2002 in the Washington, DC offices of People For the American Way. Its initial membership consisted of approximately 70 organizations. Prior to UFPJ's founding, the anti-war movement had earned a reputation as a hodgepodge of extremely radical elements. All the large-scale peace demonstrations to that point had been held under the auspices of International ANSWER - an organization aligned with the Workers World Party, a self-proclaimed Communist Party with ties to the brutal terrorist regime of North Korea.

Leslie Cagan is the co-chair and principal leader of UFPJ. She was an original founder of the Committees of Correspondence, a splinter group rooted in the Communist Party USA. A strong supporter of Fidel Castro since the 1960s, Cagan is a committed socialist and longtime activist who proudly aligns her politics with those of Communist Cuba. Over the past three decades, she has mobilized millions of demonstrators in rallies denouncing America's foreign policies; its military-related spending; and its purportedly virulent racism, sexism, and homophobia.

Cagan has often praised Castro's Cuba, which she considers a far better place than the United States. During her seven years as director of the Cuba Information Project, she led numerous demonstrations demanding that the U.S. end its economic embargo of, and travel ban to, Cuba. "In the winter of 1969-70," Cagan fondly recalls, "I spent over two months with the First Venceremos Brigade in Cuba. Just ten years into their revolution, the Cubans had taken control of their history. . . . While we were in Cuba, Fred Hampton and other Chicago Black Panthers were murdered. It was a shocking reminder of the brutality and power of the U.S. government, and there we were in Cuba, a whole nation under attack from the U.S. As Brigadistas we were taking a risk traveling in defiance of Washington's travel ban, but we knew the risk was small compared to what Cubans and so many others around the world faced every day." The Venceremos Brigades were organized by Castro's Cuban intelligence agency, which trained some "brigadistas" in guerrilla warfare techniques, including the use of arms and explosives.

Among the supporters of the many pro-Castro rallies that Cagan has attended or helped organize are such socialist entities as Casa de las Americas, the Communist Party, the Socialist Workers Party, the Workers World Party, and the Young Socialists.

I use chandelier wire from Home Depot. I think I paid $10 for 250
feet. I also have a 120' bent long wire made of 20 g tinned and
stranded Teflon coated hookup wire. When I lived on the San Sevaine
(ver, very windy) I used 23 g steel wire for a 120 foot random wire

from a house to a tree with a gallon jug of water for the
counterweight. This survived 3 days of hurricane force winds.

It's real easy to overthink antennas.

Yep,I know that Science class experiment about making Hydrogen from
Water.Gasoline from Cattle dung is a good way to put all that Cattle
dung to a good use.A guy in Colorado built a little model car that runs
on Hydrogen.The little car never needs to be refilled with Hydrogen.
www.google.com Science class model car runs on Hydrogen

Click on the Durango Herald Online article.
There is tremendous Energy in Water.Even one little cup of Water.

You're incredibly blind to the big picture. Or you are citing CRI
propaganda.
Possibly both.

> [As a side note, Bunnypants, while in India, giving them nukes, today

You're incredibly blind to the geo-political importance of India.
Or you are citing CRI propaganda. Possibly both.

> Although what you say about China is mostly true,

"Mostly" true? Please elaborate.

> it's not the only
> country that suffers from those ills.

Qualifying? Or dancing? Or?

> As I pointed out above, it seems
> like there is enough waste and greed to go around and I'm afraid you
> don't have to look all the way to China to see it.

Of course not. There is waste in my toilet every day.
Have you seen the toilet waste in Chinese W.C.'s? (facetious mode off)

> As an interesting bit of speculation, maybe, just maybe, you might even
> be able to make the case that if there wasn't so much greed here, we
> might not have gone into China so heavily, and thus not exacerbated the
> Chinese problems you so eloquently outlined above.

You don't see the forest for the trees.

This is how capitalism works and the Chinese Communists know that. The Capitalists and Communists are playing chicken with their respective economies. The question then becomes who do you think the odds favor? Communists who have little experience with free marketplace capitalistic economies? Or Big US Corp Inc.? I'll place my bets on the favorite and continue to root in their favor. Not because Capitalism is some kind of ideal social system, no. Because it is what this country operates under and is the only tool short of the military that can disassemble Communism in China at its roots. However, the sooner the murderous regime in China collapses the better off Chinese citizens and the free world will be. Especially in respect to international interests in places such as Iraq, Iran, Syria, Palestine, Pakistan, Sudan, N.Korea, Taiwan, not to forget Africa and S.America where the Chi-Comms are aggressively hammering in their wedges - Deja Vu USSR.

Once democratic forces take over in China the entire world picture becomes increasingly better in all aspects - environment, energy, freedoms, etc...

Don't be so short and narrow sited, Mr. Carter.

Hello Jon,
I got the S-38B from a Hamfest in Ocala for $30. It was recapped, but
I am doing the physical cleaning and restoring. Another one, a C
model, I just posted on one of these groups and a guy in St. Cloud, FL
had one in all original condition for $80. They are easy restoration
projects as they are so simple. They have beautiful design, they were
designed by Raymond Lowey, who designed for Chrysler in the 30's and
early 40's and did the famous postwar Studebaker, that changed how
cars looked for generations.

Just an aside for your perusal:

Greens politicize oil-drilling and ignore invasive mining.

A Canadian company has managed to lay claim to lands at the top of the watershed that contain billions of dollars worth of gold and other minerals. The problem is that it is found there in such low concentrations that getting it out will require digging an open-pit mine of gargantuan proportions and treating the "ore" thus exposed with cyanide. The pit the company says it will dig to extract the gold will be 2 miles long and some 1,600 feet deep, making it one of the largest open-pit mines on the continent.

Waste from the pit would cover an estimated 20 square miles...

Not to worry, however, if you are an interested investor. The mine's owners assured shareholders in their most recent annual report that, as a Canadian corporation, they can escape legal liability for whatever environmental damage might result from activities in Alaska.
...
The environmental lobby hasn't gotten involved because it senses there is more money to be raised attacking our addiction to oil and SUVs and the people who run the oil companies than by taking on an obscure Canadian mining operation that may actually be putting the Alaska of our dreams at risk.

Yes, I missed that, thanks for posting it. Does anyone know what the
"must Carry" stations are? National networks maybe? If I read it
correctly the small cable operators (who ever they are) still retain
the option of using dual signals for 5 years.

Anyway, that decision to not require dual signals for many actually
makes sense if we are going to move to digital TV. From the
perspective of both broadcasters and tv owners retention of dual
signals would just delay the inevitable. It's just too bad they didn't
require 100% switchover in 2009.

I'd call #8 a young man's wire -- #14 or #16 is a lot easier to wrap
around insulators and diddle with, and should work as well, and won't
be noticed by neighbors as much. I use #26 for one antenna, and it
does fine...

Didn't I see this same #8 wire on eBay about a year ago?

We REAL telegraphers KNOW that you need a 'singing wire' strung on wooden poles planted in buffalo dung for genuine Morse Code communication to happen.

CW is NOT Morse Code and is the equivalent of QRM in the hard wired communication field.

Excuse me now, I have to practice my Western Union splices again....where are those spurs..

When I used to use long wires (pre Wellbrook days), I used flex-weave.
It's also nice for portable applications since it doesn't kink like
cheap ass building wire.

Really it doesn't matter to me as I don't watch much television at all to
begin with. I guess I'll say the hell with it and listen to the radio.
Really if you look at it, television is really nothing more than mass
produced cultural BS to get the masses to buy what the advertisers want us
to buy. Most of it has nothing to do with reality. Other than the so called
news.

It's illegal now. It's buried in a footnote on one of the charts
in the liscence free regulations. You can't sell an over the air
transmitter that uses the tv channels. All consumer grade stuff that
uses TV frequencies has to use cable connections. (Exceptions for some
medical stuff and broadcast grade wireless microphones).

North Country Radio did a TV transmitter kit about 15 years ago in
Radio-Electronics magazine that used the UHF channels and got a fierce
letter from the FCC in the next issue.

For local stations, there are two options for dealing with the local cable companies. First, they can say that they are providing content, and that the cable companies have to pay them for the privilege of retransmitting their signal. The other option is that the over the air station can waive any payment from the cable company, in which case the cable company "must carry" the station.

Most "must carry" stations are religious broadcasters who know that they don't have enough of an audience to pressure the cable company into carrying them. Unlike what happens when one of the local cable companies can't negotiate a deal with one of the local stations with a network franchise and they cut off that station, and then get a large number of upset customers.

Fig. 4 is your model. You will get 50 ohms impedance per turn at 10 MHz,
75 ohms at 20 MHz and 100 ohms at 30 MHz. Regressing the chart I
estimate 20 ohms at 5 MHz.

Two problems is BALUN/UNUN are a little more picky about the core and
these are two pieces. Better to have one piece core. Depending on the
type of impedance transformer you want to make this could be an OK value
of inductance for the frequencies you want it to operate on for a
voltage type but you would want more for a current type.

Yes.

Also, please be careful with any S-38( ). It is basically an "All-American Five", five tube AC-DC radio with the typical "hot" metal chassis, depending on which way the AC plug is inserted in the outlet. The catch here is that the S-38 has a *metal* cabinet, not plastic like the bulk of the old A-A5s.

The only thing between you and an eyeball rattling shock is the plug direction and the condition of the 50 year old rubber washers between the cabinet and chassis (if they are even there at all). Please be aware and be careful!

533. #THE "VITAL LAW" PATRIOT ACT BEFORE BUSH!!

Cross-posted to: talk.politics.theory,talk.politics.misc,talk.politics.libertarian,rec.radio.shortwave

Was only practiced by the Inquisitions, the Communists and the Nazis, and then practiced by every brutal regime that didn't respect human rights!

If the Patriot Act is a "vital law" that America now needs for security...

WHY WAS IT NEVER NEEDED BEFORE BUSH???

EXHIBIT I:

Typical Voter: I am afraid to vote for John Kerry, because he is soft on terrorists! He may allow another terror attack to fall on us!
Our Response: MY, WHAT A DIFFICULT POSITION! Let us ask history and Father Time what the likelihood would be of another terror attack if John Kerry were elected!

We have noticed that every president protected us from terror on the homeland except President Bush. People then come with their results from a 911 investigation taking well more than a year after the fact to implement, constantly lying to us telling us that Bill Clinton is the one who failed us.

We therefore have to repeat ourselves so that we can show how before this country is put under seige and under tyranny, insane thoughts and practices will have to first be adopted. When it is then discovered that the American people are stupid and will allow the gestapo to do what they want, then liberty is lost!

One person lied claiming that Bill Clinton allowed terrorists to "roam free" in this country and that is what allowed 911. Below are a list of presidents that practiced since WWII. Actually ALL THE PRESIDENTS LIVED AND WORKED WHILE MIDDLE EASTERN MEN WERE ALWAYS AROUND. Bush Jr. told us that they hated our way of life because we were free. Therefore the danger from terrorism on the homeland, according to the logic of Bush, was always around since the first president of the United States.

NOTE: We do not favor Bill Clinton, nor actually urge anyone to vote in any way. If you voted for John Kerry, we believe that situations would work out the same way, THOUGH MUCH MORE SLOW! We are just here to make an illustration. We contend that all classes, parties and conflicting opinions are heavily infiltrated with enemies to this country. When Bill Clinton was in office, the heavy antagonism against constitutional principle that we now see with the Bush Administration also existed relentlessly.

We contend that through infiltration and involvement in wars, constitutional soldiers were put on the front lines in order that they may die off. When that happens, the military becomes more tyrannical based upon the kinds of military personnel in there that are spared. Because of this scenario, terrorism becomes a progressive problem.

The word was used much during the Clinton Administration, and after the 1995 bombings in Atlanta, President Clinton called for the Omnibus Anti-terrrorism Act of 1995. This legal proposal had all the principles of the Patriot Act within it.

No one had to tell any intelligent constitutional person that once this proposal was defeated and it was ascertained that the American people were not stupid enough to accept it, measures would be created to bring back those proposals again. Hence, the Patriot Act.

Still, the tenure of Bill Clinton DID NOT MAKE THE WORD "TERROR" BECOME A PUBLIC CONCERN. If Bill Clinton was weak on terror and Middle-Eastern Muslim extremists, THEN SO WERE ALL THE OTHER PRESIDENTS BEFORE HIM! Both he and the other presidents before him protected us from terror! Why then should anyone be fascinated by Bush that no terror attack has occurred after 911??? Just compare even that time with the performance of every other president before him!

But just to humor our invading fifth column army disembarking on all the free discussion outlets, let's just take a list of presidents who had their tenures WHEN JET PLANES WERE DISCOVERED, BUILT AND IN OPERATION.

Franklin D. Roosevelt 1933-1945
Harry S. Truman 1945-1953
Dwight D. Eisenhower 1953-1961
John F. Kennedy 1961-1963
Lyndon B. Johnson 1963-1969
Richard Nixon 1969-1974
Gerald Ford 1974-1977
Jimmy Carter 1977-1981
Ronald Reagan 1981-1989
George Bush Sr. 1989-1993
Bill Clinton 1993-2001
George W. Bush 2001-PRESENT

Since Clinton then, according to our invaders, allowed terrorists to "roam free." What did the men before Clinton also do to prevent terrorists from striking the homeland so efficiently!

Fifth-column traitor: OH THERE WERE TERROR ATTACKS ON THE US BEFORE CLINTON! REMEMBER WWII???

Our Response: Then state a record of the US Patriot Act, back then! [Terror is even different from acts of war from the outside. That's why Bush claimed that this is a "New Day."]

CONCLUSION: Father Time tells us that IF YOU ELECT ANYONE--EVEN
DONALD DUCK--FOR THE PRESIDENCY YOU WOULD BE PROTECTED FROM TERROR,
UNLESS YOU VOTE FOR PRESIDENT BUSH!

Thanks for the advice. I already have a modern digital receiver, so I am not so much after top-notch performance, rather than the pleasure of ownership and fun of use. However, I would still like the radio to perform at least decently, instead of finding it's only use to be, pun intended, an anchor for my boat.

:-)

My dear Susan:

Using religious dogma for a topic discussion here is doomed before you
begin. A logical discussion cannot possibly be based upon superstition.

You're more likely to get your pantied toasted than the response intended.

Dual conversion for reduced images, dual selectivities for reduced adjacent QRM, SSB mode with fine tuning, no gaps SW coverage. I feel this is the best overall SW under $100 on used market. With soft case, orig. box, manual, earphones, reel antenna. Minor signs of use, as on display area light friction or rubbing, but looks good & works like new.

I have many years of 100% positive feedbacks on eBay as george(mn). Radio sent USPS priority insured.

Cashiers check or money order for prompt shipment. Wait for clearance on personal check. Thanks for reading. 73, George (MN) (my e-mail addr has changed from BeLeever1@aol.com to georgesmn@yahoo.com as we got DSL & had to change ISP). DXer since 1965 & same addr 41 1/2 yrs.

We REAL telegraphers KNOW that you need a 'singing wire' strung on
wooden poles planted in buffalo dung for genuine Morse Code
communication to happen.

CW is NOT Morse Code and is the equivalent of QRM in the hard wired
communication field.

Excuse me now, I have to practice my Western Union splices
again....where are those spurs..

mike

When I was back in Grade 8 just before the Depression, I believe
we twisted some wires to make
the Western Union Short-Tie Splice. k35454.

You're so right David. The so-called "Patriot Act" is a violation of the US Constitution, which we are supposedly still using. But the real truth is the govt stopped using parts of the Constitution, as far back as the early 1900s, when business people started purchasing members of Congress. How long are most of you going to be in denial of the facts? If people like Benjamin Franklin, George Washington & Thomas Jefferson were alive today, they'd be in prison, maybe for life! Any member of Congress who approves something without reading it should be voted out! Are any of you with me on this one? George (MN)

I thought this might be of interest to the group. I also think it might be better served if the group changes handle to: rec.radio.shortwave&politics. That can be another thread though.

Anyway, my wife and I were listening to Gordon Liddy, on I think Cspan, while we were eating. We were going back thru time naming presidencies and so forth and the conversation got to how Iran just handed over the prisoners on the day that Reagan was inaugerated <sp?> My first thought/recollection was that THEY were afraid of the wrath that Reagan would dump on them as soon as he got hold of the reigns. Ya know, bombs away and all that sort of stuff. Perhaps I've aligned myself with somebody elses' version of history.

Here is an interesting blurb. Many I'm sure already know the story, but sometimes it is good to bring these things back into the light. If nothing else read the last paragraph. Please don't misconstru my politics by one link I've posted. I'm not saying that this is what really happened, but it certainly is an interesting slant. We all know how history gets twisted all around to suit the needs of whomever is presenting it.

How about adapting (somehow or the other) computer monitor VGA cables that already have a big ferrite core on each end of the cables to use with radio antenna hookups? Only wondering.

I think the hostages were released for more than 1 reason. 1. they
had been at war with Iraq since 9/2000 and was costing them dearly
both in lives and money. 2. Carter appointees/associates made a behind
the scene agreement to unfreeze 8 billion$ in consideration to free the
hostages. (Iran needed the money to help fight the war with Iraq.)
and 3. Iran no doubt knew Reagan was a hawk at heart and didn't need
the hassle of fighting the US and Iraq at the same time. So Iran basically
caved and released them. They had them for 440 days with "nothing"
to show for it. They got their 8 billion and the hostages were freed.
The fact that they were freed so close to Reagans swearing in was
nothing more than coincidence. He was elected in 11/2000 just
2 months after the Iran/Iraq war started, so Reagan couldn't have
officially done much of anything to get them released where as Carter
could have and did, indirectly.

Prevailing Winds magazine did a good write-up about how GHW Bush cut this deal. I'll have to see if I can dig it up.
<http://en.wikipedia.org/wiki/October_Surprise>
My recollection is the pilot that flew Bush to Iran met an untimely death, much like many that can finger the Bush Crime family. [Author JH Hatfield for instance.] I'm having a hard time remembering the name of the pilot that flew GHW to Iran, but it's been a few years. Honecker, something like that.

The Patriot Act passed 89-10 with Carl Levin (D-MI) voting with the gang of 10. Carl Levin should be more aware of the fact that his State of Michigan has the largest Muslim population in all of the USA. Combined with this fact is the reality that the FBI has arrested members of middle-eastern terrorist cells operating about the SE part of Michigan. While the economy of the State of Michigan continues its tailspin, the Michigan Senator continues on with his political profession with the likes of Ted Kennedy. To up-grade the current wiretap technology after the deaths of some 3,000 deaths in a terrorist attack on US soil is only prudent. It is simple to be a monday morning quarterback. But I would like to have those of you who oppose such security measures as the Patriot Act just what would you suggest that should be done to defend the USA? One thing is for sure, many people would like to kill as many Americans as possible in the name of their cause. If we can identify them and stop them then maybe you will be alive to continue on with your freedoms such as free speech. Until something better is proposed I will support the Patriot Act.

"seperate power" might imply a radio station would have to seperate a portion of power from the analog channel for the IBOC channels. So, a 50 kW station would have to seperate, say, 20 kW for the digital channels and leave 30 kW for the center analog channels. Is that how it works, or would the analog channel retain it's original power with the digital channels getting additional power?

Heck, at least these are the FINEST worms ever found at a ham shack estate clearance auction. They've been specially CLEANSED and are FLAWLESS, even though they may be a bit hard to see against that red velvet drape.

The former owner, a vermiculturalist from Michigan, found them just too darn complicated to communicate with and settled for a relationship with some guy named Ace, who, presumably, had less of a personality than even the worms. Rabido Mart, in a completely selfless act of kindness, took the worms off the poor vermiculturalist's hands...and that was a noble deed.

The man just gives and gives, asking nothing in return. He SHOULD be nominated for Sainthood.

I'm not aware of any anti-radio luddites, but if I ever meet one, I'll be sure to remind him to get rid of both his radios and his internet connection.

However, to an Alex Jones SWL-type distrustful paranoid, Ibiquity's IBOC looks hidden adgenda-ish. It's not about "CD quality sound" it's about multicasting.

So, if I've got it wrong, please tell me. Is it impossible for the IBOC-AM scheme to be used for multicasting?

In the SF Bay area, plenty of people listen to Sacramento stations. Bay side stations are often weak in 680 corridoor, and would be trashed if central valley powerhouses started daytime IBOC.

The SF Bay area is a market where AM does well because the terrain isn't friendly to FM, or because many people live far south of San Fransciso. I could see problems if Monterey AM stations went IBOC in the SF "normal" AM could suffer.

Afer all, IBOC isn't something for nothing. They are stealing what used to be guard bands. It is no different as if the FCC all of a sudden allowed normal AM broadcast stations to fill the empty channels.

They're presently on 3.953 LSB, and as you correctly observed, the old fossil from the midwest is in there outgassing for 20+ minutes at a time like an relief valve on an old leaky power substation oil-filled transformer in 90°F heat, as per the usual. It does however make for better listening that WWCR which only plays Brother Stinkpot Stair thru the night as the only other alternative on shortwave.

The site for the frequency of 9535 is directly from japan in English from
1700-1800 gmt. From 1500-1700 GMT it is in various languages. Tis beamed to
the Americas at 300kw from Tokyo Yamata.

Do not forget that March is the beginning month for frequenct changes to the
A06 Broadcast Schedules worldwide. Good Listening and

Hello Mark, I took the source to be distant, it was fainter than the
the signal and and the level varied somewhat. The tone varied from a
low growl to a high pitch and seemed to stop and start a couple times
though it may have just gone above the audible range. Like someone
fooling with the BFO. There was no discernable pattern to the rising
and falling of the pitch, and going into CW mode and zero-beating the
signal had no effect on whatever it was I was hearing.

>If it's local, some switching power supplies use a "spread spectrum"

Right now centered at about 4.811 I'm hearing a strong, steady
occilation with a second, hard to describe variable quality. Sort of
like the occilation is occuring in a cavity of constantly changing
shape and dimension. This is something different.

The Patriot Act passed 89-10 with Carl Levin (D-MI) voting with the gang of 10. Carl Levin should be more aware of the fact that his State of Michigan has the largest Muslim population in all of the USA. Combined with this fact is the reality that the FBI has arrested members of middle-eastern terrorist cells operating about the SE part of Michigan. While the economy of the State of Michigan continues its tailspin, the Michigan Senator continues on with his political profession with the likes of Ted Kennedy. To up-grade the current wiretap technology after the deaths of some 3,000 deaths in a terrorist attack on US soil is only prudent. It is simple to be a monday morning quarterback. But I would like to have those of you who oppose such security measures as the Patriot Act just what would you suggest that should be done to defend the USA? One thing is for sure, many people would like to kill as many Americans as possible in the name of their cause. If we can identify them and stop them then maybe you will be alive to continue on with your freedoms such as free speech. Until something better is proposed I will support the Patriot Act.

You've chosen perceived "safety" over freedom, Slaves wanted the opposite.

As do I. Especially since it is only perceived safety. It's not a safe
world, we can't be afraid of every boogieman that comes along or we have no
freedom, no life. As long as these people (whether Al Qaida or our own
government) have people gripped in fear, then we have nothing but fear.

Hi
I am wondering if I have my longwire set correctly, maybe you could advise please.
At the moment I have a sloping long-wire of about 50 foot, going from the top of a mast on my house about 35 foot tall to the top of a washing line post about 12 foot tall. I have connected the lonwire to my radio by means of CB-coax, what I have done is to attach the centre core of the coax to the longwire and I have cut the outer sheath on the coax near to the ground and connected an earhtwire that is soldered to a cold water main supply pipe as an earth.
Only the centre wire on the coax is connected to the actual longwire.

Is there a way I could do better.

I am thinking about getting an active antenna, the Sony AN-1

Would this work better for me or is there a better alternative available.
I am running an Icom R72
thanks
Rikk

I've got an idea. Why don't we find out who these people are in the US that
are causing the problems especially the Muslims and deport their asses. We
done it after the Revolutionary War in 1783 where about 20 percent of the
population was forced out. Why allow a fifth column in the US?

You have a religion that advocates jihad and revolution. Just like the
Jewish religion and the Muslim religion, they are both Code of Hammurabi
religions. Where is the peace? These people have been fighting forever so

let them find their own places to sit and cause problems. Another thing is that US border security has become so piss poor that you have people in this country and we don't know who they are? That is not border security in any sense of the word.

The Man Who Taught His Asshole to Talk
(Excerpt from Naked Lunch)
William S. Burroughs
Did I ever tell you about the man who taught his asshole to talk? His whole abdomen would move up and down you dig farting out the words. It was unlike anything I ever heard.

This ass talk had sort of a gut frequency. It hit you right down there like you gotta go. You know when the old colon gives you the elbow and it feels sorta cold inside, and you know all you have to do is turn loose? Well this talking hit you right down there, a bubbly, thick stagnant sound, a sound you could smell.

This man worked for a carnival you dig, and to start with it was like a novelty ventriliquist act. Real funny, too, at first. He had a number he called "The Better 'Ole" that was a scream, I tell you. I forget most of it but it was clever. Like, "Oh I say, are you still down there, old thing?"

"Nah I had to go relieve myself."

After a while the ass start talking on its own. He would go in without anything prepared and his ass would ad-lib and toss the gags back at him every time.

Then it developed sort of teeth-like little raspy in-curving hooks and started eating. He thought this was cute at first and built an act around it, but the asshole would eat its way through his pants and start talking on the street, shouting out it wanted equal rights. It would get drunk, too, and have crying jags nobody loved it and it wanted to be kissed same as any other mouth. Finally it talked all the time day and night, you could hear him for blocks screaming at it to shut up, and beating it with his fist, and sticking candles up it, but nothing did any good and the asshole said to him: "It's you who will shut up in the end. Not me. Because we dont need you around here any more. I can talk and eat and shit."

After that he began waking up in the morning with a transparent jelly like a tadpole's tail all over his mouth. This jelly was what the scientists call un-D.T., Undifferentiated Tissue, which can grow into any kind of flesh on the human body. He would tear it off his mouth and the pieces would stick to his hands like burning gasoline jelly

and grow there, grow anywhere on him a glob of it fell. So finally his mouth sealed over, and the whole head would have have amputated spontaneous ï¿½ (did you know there is a condition occurs in parts of Africa and only among Negroes where the little toe amputates spontaneously?) ï¿½ except for the eyes you dig. Thats one thing the asshole couldn't do was see. It needed the eyes. But nerve connections were blocked and infiltrated and atrophied so the brain couldn't give orders any more. It was trapped in the skull, sealed off. For a while you could see the silent, helpless suffering of the brain behind the eyes, then finally the brain must have died, because the eyes went out, and there was no more feeling in them than a crab's eyes on the end of a stalk.

The Soldiers Speak. Will President Bush Listen?

By NICHOLAS D. KRISTOF

When President Bush held a public meeting with troops by satellite last fall, they were miraculously upbeat.

And all along, unrepentant hawks (most of whom have never been to Iraq) have insisted that journalists are misreporting Iraq and that most soldiers are gung-ho about their mission.

Hogwash!

A new poll to be released today shows that U.S. soldiers overwhelmingly want out of Iraq -- and soon.

The poll is the first of U.S. troops currently serving in Iraq, according to John Zogby, the pollster. Conducted by Zogby International and LeMoyne College, it asked 944 service members, "How long should U.S. troops stay in Iraq?"

Only 23 percent backed Mr. Bush's position that they should stay as long as necessary.

In contrast, 72 percent said that U.S. troops should be pulled out within one year.

Of those, 29 percent said they should withdraw "immediately."

Well,my computer to computer monitor fifteen feet long VGA has a big ferrite core on each end of the cable.I paid sixty dollars plus ten dollars shipping & handling for my cable,I bought it from www.si87.com in Bozeman,Montana about three years ago.The two ferrite cores on the cable help to reduce/prevent ghosting images on my 22 inch screen CRT Multisync computer monitor.Sure,I could have connected two cheap cables together,but I wont go any cheapo route as regards my computer equipment.My computer monitor sits on my coffee table and my computer is about fourteen feet away on an end table by doggys couch.Three big eyes (two tv sets and my computer monitor) staring back at me.I dont know if a VGA computer cable will work for hooking up to a radio though,I guess it's worth a try if it doesn't blow up the radio.I wont be the one to try it first.

Hi Bob

Thanks for explaining the above - but why has this newsgroup been hijacked by "politics", its a radio hobbyists group surely? Why not post "OT" comments to a group where they are "On Topic" - seems the obvious thing to do!

Sorry to state the obvious but its that simple.

73s (to radio hobbyists)

Best wishes

Mike

Fourteen Characteristics of Fascism

Dr. Lawrence Britt, a political scientist, wrote an article about fascism which appeared in Free Inquiry magazine -- a journal of humanist thought. Dr. Britt studied the fascist regimes of Hitler (Germany), Mussolini (Italy), Franco (Spain), Suharto (Indonesia), and Pinochet (Chile). He found the regimes all had 14 things in common, and he calls these the identifying characteristics of fascism. The article is titled 'Fascism Anyone?', by Lawrence Britt, and appears in Free Inquiry's Spring 2003 issue on page 20.

The 14 characteristics are:

1. Powerful and Continuing Nationalism -- Fascist regimes tend to make constant use of patriotic mottos, slogans, symbols, songs, and other paraphernalia. Flags are seen everywhere, as are flag symbols on clothing and in public displays.

2. Disdain for the Recognition of Human Rights -- Because of fear of enemies and the need for security, the people in fascist regimes are persuaded that human rights can be ignored in certain cases because of "need". The people tend to 'look the other way' or even approve of torture, summary executions, assassinations, long incarcerations of prisoners, etc.

3. Identification of Enemies/Scapegoats as a Unifying Cause -- The people are rallied into a unifying patriotic frenzy over the need to eliminate a perceived common threat or foe: racial, ethnic or religious minorities; liberals; communists; socialists, terrorists, etc.

4. Supremacy of the Military -- Even when there are widespread domestic problems, the military is given a disproportionate amount of government funding, and the domestic agenda is neglected. Soldiers and military service are glamorized.

5. Rampant Sexism -- The governments of fascist nations tend to be almost exclusively male-dominated. Under fascist regimes, traditional gender roles are made more rigid. Opposition to abortion is high, as is homophobia and

anti-gay legislation and national policy.

6. Controlled Mass Media -- Sometimes the media is directly controlled by the government, but in other cases, the media is indirectly controlled by
government regulation, or through sympathetic media spokespeople and executives. Censorship, especially in wartime, is very common.

7. Obsession with National Security -- Fear is used as a motivational tool by the government over the masses.

8. Religion and Government are Intertwined -- Governments in fascist nations tend to use the most common religion in the nation as a tool to manipulate public
opinion. Religious rhetoric and terminology is common from government leaders, even when the major tenets of the religion are diametrically opposed to the
government's policies or actions.

9. Corporate Power is Protected -- The industrial and business aristocracy of a fascist nation often are the ones who put the government leaders into power,
creating a mutually beneficial business/government relationship and power elite.

10. Labor Power is Suppressed -- Because the organizing power of labor is the only real threat to a fascist government, labor unions are either eliminated
entirely or are severely suppressed.

11. Disdain for Intellectuals and the Arts -- Fascist nations tend to promote and tolerate open hostility to higher education, and academia. It is not uncommon
for professors and other academics to be censored or even arrested. Free expression in the arts is openly attacked, and governments often refuse to fund the
arts.

12. Obsession with Crime and Punishment -- Under fascist regimes, the police are given almost limitless power to enforce laws. The people are often willing
to overlook police abuses, and even forego civil liberties, in the name of patriotism. There is often a national police force with virtually unlimited power in
fascist nations.

13. Rampant Cronyism and Corruption -- Fascist regimes almost always are governed by groups of friends and associates who appoint each other to
government positions, and who use governmental power and authority to protect their friends from accountability. It is not uncommon in fascist regimes for
national resources and even treasures to be appropriated or even

outright stolen by government leaders.

14. Fraudulent Elections -- Sometimes elections in fascist nations are a complete sham. Other times elections are manipulated by smear campaigns against (or even the assassination of) opposition candidates, the use of legislation to control voting numbers or political district boundaries, and the manipulation of the media. Fascist nations also typically use their judiciaries to manipulate or control elections.

[see http://www.secularhumanism.org/library/fi/britt_23_2.htm for complete text of article.]

You'll see a huge improvement if you using a matching transformer between
the long wire and the coax. Also try to keep that matching transformer as
far from the house as possible.

YLE R. Finland, Pori Finnish excellent signal with man and woman alternating reading news with clips from correspondents in the languages of the country in which they are in.

It's been a while since I last heard this station and the signal is is excellent.

All life all holiness come from you O Lord

Hi David
I visited the website you mentioned. and think the LMZ-50 would be best for
me.
How exactly does this work please, do I simply connect the longwire to the
balun, and the run coax from balun to radio via cb coax.
thanks
Rikk

643. Bulgarian SW Station in Sofia

Newsgroup: rec.radio.shortwave
Date: 2006-03-05 16:20:20 UTC
From: ricknj10@hotmail.com
Message-ID: <440b0e4e.74256015@news.optonline.net>
Source record: 66081

As your flight comes in for a landing in Sofia, Bulgaria you fly over a shortwave transmitter site. It's a few miles out of town on a high piece of ground along a two lane road. Several huge towers.
I am wondering what station it is, and whether it is active. A native Bulgarian (my wife's father, actually) told me it was "A transmitter from the Communist days that covered up other signals."
Is this Radio Bulgaria? All I have managed to find was a posting on this group from a few months ago that said a Radio Bulgaria transmitter site was located in Plovdiv, a couple hours from Sofia.

Mine was gone starting Friday morning, them having had a week to figure
out where to get a replacement filter cap in Cuba, I guess.

It turned out to be very handy, nulling the hum being an excellent
way to get rid of the babble from the south in favor of WFAN NYC,
being a constant source to gauge things off of.

That sounds like a good rig, but it is going to be more efficient at lower frequencies. You might rig up another one about 1/4 that length and use it for higher frequencies.

50 feet=50x3.28=164 meters
300/164=1.8 Mhz which is in medium wave band

12 feet=41 meters
300/42=7.31

6 feet=19.68 meters
300/19.68=15.24 Mhz

While it isn't necessary to have an exact match, down to the millimeter, getting the length nearly correct is important, because of the signal strength losses mentioned in the previous post. This is why a longwire is very useful for very low frequencies. At higher frequencies you get more noise than signal.

If you try to use a high power transmitter with an antenna badly matched for the band on which you are transmitting, most of your energy will simply comes crashing back at your trasmitter and burn up your circuitry <s>.

Some lucky individuals intersted in very low frequency phenomena have the space to run wires miles in length, and need special arrangements to accommodate the incredible voltages generated. Many very strange natural signals lurk on frequencies that would be voice frequencies if they were sound, and are very strange indeed.

You can use plain old RG-6 Cable TV coax if you like. You use a 75
Ohm matcher at the antenna and the appropriate mechanical adapter at
the receiver. If you have a portable, use a flexible adapter to keep
strain off the little plug.

TV *IS* selling something, but it may be not be what you think. The networks are selling YOU, the audience, to the advertisers.

Every poll or survey taken about viewing habits and programming is used to be better able to package the viewing audience and make them more attractive to the potential advertiser.

Yeap! No more "God Bless America" or "Pledge of Alegiance" (under God) in
our Socialist Public School systems.
No more 4th of July Parades - just slogans for Communism.

> > 2. Disdain for the Recognition of Human Rights -- Because of fear of

Yeap! Don't walk down the streets at night in L.A. You'll either be shot or
assaulted by a L.A.'s finest in blue.

> > 3. Identification of Enemies/Scapegoats as a Unifying Cause -- The

Yeap! Stay away from all Muslim communities or other locations that
Islamo-facists reside. Watch out for maurading Islomo-facists in SUV's.

> > 4. Supremacy of the Military -- Even when there are widespread
> > domestic problems, the military is given a disproportionate amount of

> > are glamorized.

Yeap! Watch out for widespread domestic problems while travelling in China.
As their facist government is siphoning mony from social programs into
developing a full array of ballistic nuclear missle systems as well as

creating a true blue water navy capable of global reach.

Yeap! Stop kissing our returning soldier's feet and showering them with flowers. Better to protest at dead soldier's funerals.

Hi Guys
Thanks all very much for your help, I appreciate your comments, I have opted
to order a balun from a supplier mention on this thread and see how it goes
from there.
I shall also try a few of your other suggestions as they are really
interesting in therory.
As you can probably see, I am relativly new to sw and until now have been
using the SW77 on it's telescopic antenna, but time for me to move forward a
bit, so I will see what I can do with the R72
thanks again

Because recording edited. Start of it chopped off to make lie out
of what left. Even what Kool Aid drinker Dave say is lie. Rielly
say he have fox security call local police because of call.

Kool Aid drinkers want to believe opposite becaues first of all they
hate fox. All else follow from that. They try so hard pin lies
on Reilly and fox that they look like kooks they are.

It's not a given that cutting back the antenna will yield better
reception. You are reducing the aperture.

Yea, that's CODAR. I think that it's two carriers getting FMed
across a bandwidth.

I've been getting some really strong interference on Radio Australia
on 5995 kHz, during the 16:00 hour. Either somebody is keying up
a couple of kHz off that, or an adjacent channel station is putting out
a audio tone. No variation in frequency, just a damn loud het.

It is about making money. If a station, equipment vendor or the two of
them together can get an advantage in the market over a competitor then
they will do it. If they can put a competitor at a disadvantage they
will do it. The entire conspiracy is to make money. That the whole story.

Hi
I just cleaned the pipe itself with a wire brush till it was shining like new, got a jubilee clip (car hose clip) and put the ground wire through the clip, tightened the clip on the pipe then used my heavy duty solder gun, I ran a test with my multimeter and it is giving a good ground.
cheers
Rikk

Does anyone have experience with 110/220volt transformers along with a shortwave radio imported from China? I heard someone complain about the fact that the transformers coming from China aren't tested by Underwriters Laboratories.

I have a Tecsun PL550 from Liypn and the 220v transformer that came with it is fine, on for hours at
a time and
slightly warm to the touch. Also charges batteries with no problems.

With my DE1103, which didn't come with the transformer, I use only Duracell rechargeable batteries
and a
Maha charger. One set in the radio, another set charged when needed. This eliminates any powerline
interference
and also negates worry about the imported transformer if that is a concern.

My Sangean-made C.C.Radio has a display that became inscrutible after
about a year -- it stopped showing the appropos numbers. Don't know
that all Sangean radios do that, but mine did.

As to DXers, I find that most today are very opposed to changes in radio,
whether formatically or technically, and are very negative towards the way
stations operate. I have disassociate myself form DX organisaions as they
almost all seem to be out to change radio to the detriment of those of us
who work in the field.

Since essentially no radio listening, in terms of percentage, is skywave
night listening, the other poings are moot.
>

It is about all of this. It is about giving radio the digital buzzword, more
channels, and improved AM quality.
>

> scheme to be used for multicasting?

Pretty much so. Not enough bandwidth unless analog is dropped and all the
signal is devoted to digital.

There is no ratings evidence of any listening in the SF market to Sacramento stations in the Bay Area. There is some in the area nearer Sacto than SF, however.

If you don't have too much man-made noise inside your house, you might
consider bringing the random wire all the way to the 500-ohm terminal
on the back of your receiver, and run your ground wire from the
terminal next to it to your cold water pipe. This gets rid of the
mismatch between your high impedance antenna and low impedance coax,
and you don't need the balun at all, which is fine, because the balun
only provides an approximate impedance transformation.

Another alternative would be to bring the long wire into your house,
and attach it to an inexpensive random wire antenna tuner, such as an
MFJ 16010, about $49 US. Then run a short length of coax from the
tuner to your radio's 50-ohm input. As you go to each new frequency,
peak the knobs for maximum signal strength.

Yet another alternative, keep your current antenna; add the balun to
it or whatever. But put up a 2nd antenna, perhaps aimed in a different
direction, and run it to your high impedance terminal. Switch between
the two antennas for best reception on a given signal. You could do
some interesting A-B comparisons on antennas.

You are off to a good start and as someone else in the thread already
mentioned you could improve the random wire performance with a UNUN
impedance matching transformer at the coax/random wire junction.

This wire should already be working better then the whip. You can tune
through the bands to get an idea how well it is working. Usually good
wire performance will start at the 1/4 wavelength frequency of the wire
length and will work well from that frequency on up except at even
multiples of that 1/4 wavelength so 1/2 wavelength would not be good.

As long as the even multiple does not fall on a SW band you are OK.

Some people use more than one wire. I think this is a game plan that DxAce uses with two separate wires one twice the length of the other. I think he uses a 100 and 200 foot lengths. Where one would be at zero volts at the end of the wire the other would be at maximum. If at a non-resonate wavelength they could look the same.

Since your long length is 50 foot you tie on another 25 foot wire at the coax junction and hang the far end off the 50 foot wire a few feet with an insulator of fishing line as an example. Not as clean as two separate wires but it should work well.

A 50 foot wire in air should be 1/4 wave resonate at about 9.7 MHz. The 9 MHz band would be your best to pick up signals with the 50 foot wire.

Both the NRC, of which I was a member going back to the 50's and the IRCA,
which I helped found, are increasingly populated by anti-radio people who
are antagonistic towards the stations and the industry they DX. Add that to
the fact that all I seem to see at our AMs are faked DX reports (last one
was a "definite" ID for a name KTNQ has not used for 13 years) and I am
quite down on AM DXers as a group.

Clarification: except for you and a couple of Brother Stari kooks, SW DXers are as a whole a really interesting group, and have a much less insular view of things.

> Seems to me like you got your ass handed to you in most any discussion you
> entered into.

Hardly. The fact that a bunch of radio haters is against the progress of radio actually supports my argument against the majority of AM (MW) DXers.

I think there's a show late night saturday eve. that you can catch
around 9685-9690, but there can be interference from Chinese
casts.Check out Channel Africa's website for other freq.It too, fades
in and out and sometimes is strong, sometimes garbled.

Nice Yaesu FGR-7700 HF receiver 3E serial number. Complete with
Matching Yaesu FRA-7700 Active antenna.
Radio is clean and working well, no memory unit. Missing feet? and
small plastic covers on ends of carry handle are broken. This does not
affect the use of the handle just the cosmetics of the right side. This
is how I received the radio.
Complete package is $325 shipped FedEx ground and insured and well
packed (double boxed) Sorry I will not sell the FRA-7700 seprate.

Those were good years. Sunspot numbers were up near 200 back then. I
got my ticket in time for the next cycle peak around 2000. I wonder
what it was like around 1958 when the numbers reached around 250?
That must have been awesome.

But on the other hand I managed to work two stations in Japan this
afternoon which I never expected. They were at the upper end of 20
meters. Pretty weak but there was no big pileup and I was surprised
they heard me with my terrible SWR. There is a good side to the
contests.

Source record: 66009

I prefer the performance of the 7600G. I generally prefered running a length of wire to improve the sensitivity of the '909, whereas I didn't always find this to be required for the 7600G. I tended to run both off of batteries, rather than off AC. The '909 is something of a battery hog, whereas the 7600G is not. As for selectivity, while I liked having two bandwidths w/the '909, the 7600G's synchronous selectable sideband can be a real life-saver in dealing w/adjacent channel interference (as well as fading). Given a choice between either dual bandwidth filters or synchronous selectable sideband (in conjunction w/one well chosen bandwidth filter) in a compact portable, I guess I'd go (as I have) with the latter. Sold the '909 and haven't regretted having done so.

Coast Guard Hunts Prankster Behind 'Sinking' Distress Calls

POSTED: 10:24 pm EST March 4, 2006
UPDATED: 5:22 pm EST March 5, 2006

The U.S. Coast Guard is searching this weekend for the person who radioed several distress calls reporting that vessels were sinking after the transmissions were determined to be pranks, according to a Local 6 News report.

Officials with the Coast Guard said they have received three distress calls since Thursday about boats sinking, including a call Saturday.

After an investigation, it was determined that the prank calls were made from the same person. Investigators have also narrowed the search to a radio located between St. Augustine and New Smyrna.

Local 6 aired audio of one of the calls; "Coast Guard, this is a distress," the caller is heard saying. "Mayday, mayday. Stand by for long (longitude) and lat (latitude)."

"Roger that," the Coast Guard responds.

"Mayday, mayday, we are going down," the caller said.

After the call, Coast Guard and Navy crews spent eight hours searching for the vessel with jets, helicopters and boats at the cost of $60,000, according to the report.

The person responsible for the hoax calls could face up to 10 years in prison.

Watch Local 6 News for more on this story.

Two quick notes:

1. We were KE0GG/C54 in The Gambia (sandwiched between north and south Senagal) in '90 -- caused quite a few pile-ups on the east coast.

2. On old associate (W?4APL) told me he earned his Technicians license in 1958. I think it was the also the International Geophysical Year giving incentive to many young people at that time to get their first ticket. He said he talked to Europe on 6 meters like talking "across town". DX'ing was in his words "the best ever".

Regards,

John

My 909 and dx398 are both still fine after more than three or four years
of use. I returned a 7600 when I found no noticeable difference in use
with or without the synch detector. The lack of a proper tuning knob was
another deciding factor.

My very first transcontinental DX was 6W8DD on 15M novice band about 1963.
What a thrill- I was probably a bit of a lid as I had no clue how to work a
pile up- but there were gentlemen on the band back then and willing to put
up with a novice.

> United Kingdom

The antenna configuration you have is similar to a 'sloper' design where
one end is higher than the other. To reduce the reception of noise from
appliances in your home, it's better to locate the balun (unun) near the

ground (earth) instead of in the air at the end of the antenna. This means you should extend the feed end of the antenna to the ground with a single vertical wire (not coax) and connect that wire to the high impedance input of the balun. The low impedance output of the balun goes to the coax that should run on/in the ground to the house. Having the balun and coax near the ground will allow you to use a short ground wire from the balun to a ground rod near by. This helps to keep noise off the shield of the coax.
This antenna system (inverted-L) works best if both ends of the horizontal section are located away from the house. In your case you can make the far end of the antenna at the wash line pole the feed end with the vertical wire to the balun near the ground. Instead of having the near end come all the way to the mast on the house, shorten it about 20-ft and install an insulator at that end with some nylon rope to the mast. This will keep the near end of the antenna away from the house, where it could pick up noise. The vertical wire at the other end will make up for shortening the antenna at the house end. It will also help to receive signals which arrive at the antenna from a low angle to the horizon.
My antenna is very similar except I installed a 20-ft metal pole on top of the wooden clothes line pole to make that end higher above ground. This also makes the vertical wire longer for better reception.

These come in two styles. The zinc (or aluminium?) style is for indoor,
dry locations. The brass version may be buried in the soil. I'd use an
anti oxidant such as Penetrox or NoAlox on the screws and joint if
burying the connection.

I wonder how many stations they have and what power they are using. It must be tough since Russian stopped the commie welfare cheques.

China seems to have an over abundance of Shortwave facilities now, but then they have more money than they know what to do with. Fascism is profitable.

mike

Yeah, but I doubt that DaviD would be interested in any Bob who's in
any way distinct from heroin.

I haven't caught that transmission but they come in pretty good on the
west coast on 11825 KHz 07:00 to 08:00 UTC. During that time they also
transmit on 7240 KHz but I have not tuned to that frequency.

We are just so lucky that nobody watches the propaganda Hollywood dishes
out. Theaters are empty. Movie rentals have ceased. Nobody watches,
nobody listens. Everyone has shown them how wrong they are by refusing to
support their slanted views.

[and this is somehow 'radio' related?]

I can't give an opinion on the Sangean 909 because I don't own one but I
like my Sony 7600G a lot. It's a great portable radio.

The Sangean 909 is supposed to be a good radio.

I hope DRM dies a quick death.

>I hope the drm s are coming ...

I have the Radio Shack badged Sangean 909 and the 7600G. I favor the
7600G as I've found it's selectivity to be better - sensitivity on the
whip is better though that is not an issue once you have about 30 feet
of wire for an antenna. The pluses for the 909 are more memories -
though the 7600GR has narrowed the gap - a tuning knob and finer
tuning for SSB vs a 'clarifier' thumbwheel SSB on the 7600G. I've
found the synch on the 7600G to only sometimes help. Overall, I think
they're close enough that it's hard to fault somebody for choosing one
over the other - depends on which features appeal to you more.
However, the 909 is about $80 more than the 7600GR; read some other
responses, check out the summary shown in the link (still only
people's opinions but it does have a nice table that compares
features) and choose based on what's important to you.

It's more than a money issue. If someone else has a real life and death
problem while the coast guard is out looking for a faker this could
cause someone to lose their life.

bullshit

all freedom is restricted there exist no unrestrcited freedom without
total anarchy

A restriction on My freedom for example is I may shoot you under most
circumstances

but rarely has America and americans enjoyed the levl low level of
resritions we currently enjoy, but here are always limits onour freedom
and there always will be, the trick is get something , realy get
something for that freedom we must surrender in order to have a
functioning society that is worth what we give up

I am switching away from AM DXing, to exclusive SW Dxing, although I must say , it is in a sad concession to the digital age.it's inevitable that IBOC will be included during skywave, and this will benefit casual listeners in urban areas, and terminate AM DXing.I won't be getting MY way, so it's time to adapt.

Two things:

1. I question the wisdom of dismissing the hobby of dx'ing in this news
group. Sounds to me like you are trolling for trouble.

2. Like I already posted there is plenty of regional and national
commercials on radio so the long distance reception of stations does pay
off. Now you can go ahead and ignore that to continue to support your
wrongheaded assumptions.

Pretty much intentional, but they fit my lot which is 85' wide by 463 deep.

I do have a bit of leeway with the neighbours permission for some longer lengths, but this setup seems to work fairly well, and my target list these days is quite short, at least country wise.

The Lord created the Heavens and Earth in six days. On the Seventh day ,
He rested. That's the Lord's day. Most countries with a Christian
background had Sundays as holidays for the working class.

If the Lord's day is for rest, it would only make sense that it's at the
END of a period of work.

I am also aware that some religions do NOT agree with that and say that
Saturday is the last day of the week. Muslims have a mid day sermon and
congregational prayer on Fridays. Some use the Sun rising and falling as
an indication when their Holy day starts and ends.

We usually follow the dictates of the vast majority, of which you are
obviously not an invited participant.

==========
ï¿½The Lord says this, Observe the Sabbath day and keep it holy, as the Lord your God has commanded you.. For six days you shall labour and do all your work, but the seventh day is a Sabbath for the Lord your God.ï¿½

The batteries seem to last well for me also. I attribute some of this
longevity to the fact that I use earphones a lot and they don't take as
much power to drive as the built in speaker.

I'm quite envious of the fact that you can use that type of antenna.
Much to electrically noisy around here for me to do that and about 40
feet is the best I can do anyway on this small lot.

My question is, why are Americans so afraid to die? We have 1.3 billion Muslims who are not afraid to die, and 300 million Americans who are terrified to die, who has the upper hand? W needs to tell Americans that they will go to heaven and be with Jesus if they become suicide bombers blowing up Muslims. Fight fire with fire. The best way to defend the USA is to stop being so goddamn fearful. FDR realized it, and he used it to America's advantage in WW2. Americans are like cockroaches who scatter when the light is turned on because they're afraid of their own shadows.

Americans hold on to jobs that amount to little more than slave labor by the hour because they're terrified of not having enough food and enough goodies. Americans blindly follow a leader who plays the fear card to get elected, and considers him a protector-god who will save them from the bogeyman. Americans are pathetic. Fat, lazy, uneducated, stupid, and fearful.

Just trying to read the old messages after the huge effort to purge the many messages that are not relevant.

The article referenced below is still available - wonder-of-wonders. I worked at Green Bank in the late 50s and it was very radio quiet. To make sure that I did not cause a problem, I would drive over the next ridge to operate my amateur radio station that I keep on the back seat of my 7 cylinder Chrysler. Eventually, it was found that I could operate on the site without causing a problem. I ran a dipole between two trees that were next to Reber's old antenna (used to make the first radio map of the sky). He was a very interesting fellow. Sensitivities were not as good then as they are now.

Sure a good place to listen and to see. The article is worth a read.

Theater attendance down.

Ditto for rentals at walk in outlets.

One reason, competition from mail order rentals.
At ten dollars per month for up to 3 titles per day,
and their online catalog has thousands to chose from.
My mailman says he delivers more every week, up
to a hundred rentals per week now on his typical middle
class residential route.

I've had the Dx-398 (909) for about 6 years, and I still love it like it was brand new. I've had the 7600GR for about 2 years and am indifferent to it in my portable collection. Myself, I think the Sony is overated. I dont like the tuning at all. The antenna on mine broke right away, and sync seems OK, but nothing to scrap my 398 over. I would not sell the Sony, because I value all my portables, but it does not get much use. However, overall reception is good on it, and in the end, thats why I like Shortwave Radio Listening. There's something good in all of them that can pick up shortwave radio HF signals, that's just my opinion. It's just about the DX.

I sepcifically clarified that it was domestic (NRC and IRCA) MW DXers. For
some reason, they have chosen to attack broadcasting as an industry and
profession. Some even write letters to the FCC questioning the
qualifications of licensees who are doing exactly what the FCC wants:
improving local service.
>
> 2. Like I already posted there is plenty of regional and national

I know of less than a dozen stations today that make any money off skywave,
and out of 13,500 US AM and FM stations, less than 200 show up in ratings
outside their own market area (MSA and embedded metros).

It is tough to have a high regard for AM DXers these days when they complain about your management, programming and technical operation, and then send one after another of false DX reports. As mentioned, the last one (on Thursday) reported listening to KTNQ with a slogan that has not been used for 13 or 14 years ("Radio Fiesta") and had a log of musical selections (KTNQ is talk).

I found the sync on the 7600G better than on the 2001D/2010D ...
Have had both radio's, but kept the 2001D for its other features as sens
& signal meter etc. I use a hula hoop ant and that's fine ...

I think that if you want to *practice* spanish, SW is most definately
the way to go.If you want learn it well get a text book and take a
course in it.The reason that they do that with Chinese and Japanese is
because they are so foreign to someone who is an anglophone.Actually ive
never heard CRI do chinese lessons *thinks*.

So do I, I'm running on ni-mh 1700 mAh rechargeable batteries and it last 2 to 4 weeks depending on how often/long I listen to the radio.

I can't speak for the 7600 I never had, but I have also the Sony SW100 and sensitivity of the 909 is above the Sony. The Sync of the Sony does help sometimes, but often the 909 has a better signal anyway.

I'll stay with the 909 for the DX with an external antenna... And yes, the tuning knob is quite compfortable...

804. Question : What Will . . . My Second Shortwave Listener (SWL) Antenna Be ? {Making Use of the High-Z (500 Ohm) Terminals} - Think Windom Antenna with 300 Ohm Feed-in-Line !

Newsgroup: rec.radio.shortwave
Date: 2006-03-06 11:30:32 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1141644632.830860.230290@i40g2000cwc.googlegroups.com>
Source record: 66044

BM [K5QWG] - Those were Three Good Antenna Suggestions.

IF - The Low-Z (50 Ohm) SO-239 Connector on the Receiver is being
used for some sort of LongWire {Random Wire} Antenna that is using
a Matching Transformer and a Coax Cable Feed-in-Line.

NOTE - My Favorite is the Inverted "L" Antenna with with the
Vertical-Up-Leg at the Far-End and a Remotely Located
Ground Rod at base of the Far-End of the Antenna; also
using a Matching Transformer (UnUn) between the Wire
Antenna Element and the Coax Cable Feed-in-Line and
having the Coax Cable run directly under the Horizontal
Arm of the Antenna.

READ - ABOUT - The "Low Noise" Antenna design concepts
that were popularized by John Doty :
http://groups.google.com/group/rec.radio.shortwave/msg/9586383afa7727a9

http://groups.google.com/group/rec.radio.shortwave/msg/a438b087b5e89fee

http://groups.yahoo.com/group/Shortwave-SWL-Antenna/message/5178
http://groups.google.com/group/rec.radio.shortwave/msg/43463ad863e5b075

http://groups.google.com/group/rec.radio.shortwave/msg/254620d18b66eeba

http://groups.google.com/group/rec.radio.shortwave/msg/103fe02cad4e5650

http://groups.google.com/group/rec.radio.shortwave/msg/87d35eeaa8425c14
http://groups.google.com/group/rec.radio.shortwave/msg/a57711375bb4d0bb

THEN CONSIDER A SECOND SHORTWAVE ANTENNA
- - - THINK WINDOM ANTENNA ! ! !
As you observe the High-Z Terminals (500 Ohm) are not being used.
So the High-Z Terminals (500 Ohm) are available to connect a
Second (2nd) "Alternate" {Back-Up} Antenna to the Receiver.

QUESTION : What Will . . .
My Second Shortwave Listener (SWL) Antenna Be ?
{Making Use of the High-Z (500 Ohm) Terminals}
! Think Windom Antenna with 300 Ohm Feed-in-Line !

My Choice for this Second "Alternate" {Back-Up} Antenna
is a Windom Antenna using 300 Ohm TV type Twin Lead
as the Feed-in-Line and simple 20 AWG Hook-Up Wire
as the Wire Antenna Elements.

The Two 'un-equal' Horizontal-Arms of the Windom Antenna
can be Cut for your Target Shortwave Bands or simply
Cut-to-Fit the Available Space allowed by your Lot (Land).

TIP - The Off-Center {Center} Connector for your Windom
* Ten-Tec 3003 Acro-Bat (Dipole Antenna Hanger)
http://www.universal-radio.com/catalog/antsup/3720.html

Windom Antenna = Available Space Tip-to-Tip (T2T) Length
* Short Horizontal-Arm 33% ~ 38% of T2T Length
* Long Horizontal-Arm 62% ~ 67% of T2T Length
* How High ? Rigged the Windom at 25% of T2T Length

Windom Antenna = Cut-to-Shortwave-Band

Large Size - Windom Antenna {~ 100 Feet}
Cut for : 60 Meters = 75 Meters + 49 Meters
T2T = 97.7 Ft = 59.2 Ft + 38.5 Ft and Rigged at 24.5 Ft High

Medium Size - Windom Antenna {~ 65 Feet}
Cut for : 41 Meters = 49 Meters + 31 Meters
T2T = 63.0 Ft = 38.5 Ft + 24.5 and Rigged at 17.1 Ft High

Small Size - Windom Antenna {~ 50 Feet}
Cut for : 31 Meters = 41 Meters + 25 Meters
T2T = 51.5 Ft = 31.8 Ft + 19.7 Ft and Rigged at 15.1 Ft High

Mini Size - Windom Antenna {~ 40 Feet}
Cut for : 25 Meters = 31 Meters + 19 Meters
T2T = 39.6 Ft = 24.5 Ft + 15.1 Ft and Rigged at 10.8 Ft High

RIGGING - Ideally the 300 Ohm Twin Lead Vertical-Up-Leg
of the Windom Antenna should run Straight-Up (Vertically)
from the Ground to the Off-Center Mounting Point of the
Antenna and the Rule-of-Thumb for this simple type of
Windom Antenna is to have the Antenna's Horizontal Arms
Rigged [Flat] at about 25% of the Tip-to-Tip (T2T) Length
of the Antenna. Note - The remainder of the Twin Lead
Feed-in-Line can run along the Ground and then to the
Receiver.

I emailed Radio Bayrak to inquire as to whether they were still on and here is the reply:

We do have transmissions on SW 6150 kHz from Northern Cyprus. This is a 24 h transmission with manual operation from 04:30 UTC to 22:00 UTC and automated broadcast from 22:00 to 04:30 UTC (00:00 to 06:30 local time).

810. Ferrite core : yes it works... Now for the antenna...

Newsgroup: rec.radio.shortwave
Date: 2006-03-06 13:27:14 UTC
From: Charly <no.spam@no.email>
Message-ID: <440c38bb$0$21539$626a54ce@news.free.fr>
Source record: 66200

Thanks to all for the replies...

With the hints received here and elsewhere, I finaly made my firt unun with the piece of ferrite I found...

I used magnet wire retrieved from an old broken AC/DC adaptor :
- 2 turns for the radio side,
- 8 turns of wire antenna side, making a 4:1 unun.
Currently the unun is just beside the radio (no coax or whatever : just a few centimeter of wire connected in the radio), grounded via the outer radio/antenna connector.

And yes it works ! At least connected to the ATS909 : it increases the signal level by two bars and the sound is clearer. The result is not that obvious with the SW100, perhaps due to a different antenna connection impedance (anyone knows the Sony SW100 or AN100 antenna connection impedance ?).

Next step : mounting an inverted L antenna between my house the one of the tree near-by : connection in the attic, going through the attic length (to have a longer wire), passing through a tiny hole between the wall and the roof, reaching the tree at something like 5 meters above the ground, then going down the tree.

At what heigth should I stop the vertical leg above ground ?

The horizontal leg will around 12 meters (say 8 meters in the attic, 4 meters outside : I can't go longer in this city environment).

Feeding will be a 75 ohms coax grounded via some house's water pipe : it seems that the 909 has a 100 ohm antenna connection impedance... so it will be a better match than 50 ohms (unless I put another 2:1 unun just before the radio of course).

In radio with my (poor) electronic knowledge, the more fun is building the antenna stuff... :-)

Oh yes : I need to try the snake-in-the-attic antenna as well...

Charly

I wouldn't be so sure. Half the population lives beyond the suburbs
and distant night time signals are fairly vital. Besides, the IBOC
makes the AM sound pretty bad.

I'm not so sure how well the 505 will take a good
external antenna. I know the 398 and the old 803a
did well, but the 505 I have little experience in.

If he's looking for something in the 300-400 dollar
budget, there's a plethora of used radios that fit
in that range. All depends on his listening habits.

828. Noise Shut Me Down

Newsgroup: rec.radio.shortwave
Date: 2006-03-06 16:03:54 UTC
From: Radio TexMex <ke5ckrIGNORECAPS@gmail.com>
Message-ID: <KL-dnf8wSeKXwJHZRVn-ig@giganews.com>
Source record: 66218

I have a crackling buzzing sound that popped up a few weeks ago. It started intermittently but now it is going constant and stronger that ever. This interference shows up on all the HF bands but is strongest around 20 meters where last night I logged a healthy 40 over 9, affectively shutting me down on my favorite band.

I did my homework yesterday and took what steps I could. I turned off all the power at the main breaker box to my house and walked around with a portable AM radio that uses a ferrite rod built in. The noise still showed up on the AM radio, so I've ruled out any possible source from inside my house. Since the little portable AM radio's ferrite rod works directionally, I decided to take a stroll outside around the house with it. The interference gets loudest right underneath the power line which runs right beside my house. I followed this line down the street, radio in hand (looking pretty dorky), and the noise seems to be radiating from a bunch of different points/transformers along the same line.

I just put in a call to Pedernales Electric Company this morning and they are sending a lineman tommorrow to meet with me. I can only hope that the noise doesn't magically stop when he arrives!

Wish me luck! And any suggestions are welcome.

- Matt

OK, but couldn't much the same be said of building preservationists? They
don't like the changes and want to keep some things the way they love,
despite the fact they have no ownership interest. I wouldn't call building
preservationists anti-architecture, however.

> channels, and improved AM quality.

Well, it's only my opinion, but the digital buzzword will soon be worth about as much as the shopworn "turbo" buzzword of a few years ago. Already, digital is being associated with pixellated video and cellphone audio. By the time affordable IBOC recievers become available, the term digital may be a negative.

If there is really much demand for improved AM quality, there would be more demand for improved AM radios. Better skirt selectivity, lower distortion dectectors and real noise blankers would be installed in everyday radios. Such things are available in hobbyist radios. Most people don't want to pay even a little extra money for a radio.

I think the multichannel capability might attract the most consumer interest, if such interest develops.

Yes, but ibiquity anticipates digital radio will replace analog. Then what? Will the former analog channel be replaced with digital channels?

And might some of these replacement digital channels be pay channels?

Paranoid minds want to know!

I hope they fix that in a hurry. A surge will ruin anything electronic you have. It is adviseable to plug a radio into a good surge protector and not directly into a wall socket if at all possible.

I'm an SWL in Reno, Nv and I can't seem to find anywhere other than Radio Shack to purchase a good shortwave reciever. I've had a Grundig YB400 for a couple of years now and I want to expand on my listening post. Circuit City and other consumer electronics stores sell mini-portables and such but those are not what I am looking for. A porta-top or tabletop model like a Sattilite 800 or the new Eton E1 would be nice.... does anyone know where I can get these in Reno? Thanks.

Dwardo's right. There are Luddites among us.

Analog has a place in the future, probably the MW band at night
included (at least from 640-1200 Kilohertz). The blowtorches don't
need HD, the local stations do.

Not interested in Ebay? There is a wide variety of radios for SWLs on eBay,
and if you do some homework, smart bidding and patience you might find a
good deal.

The funny thing also, at least to my ears, is that Voice of Russia stopped broadcasting in addition to sending aid to Cuba... they have gone from being pretty prevalent here in the Northwest to rarely heard.

855. Illegal regime declares war on freedom of the press

Newsgroup: rec.radio.shortwave
Date: 2006-03-06 18:26:14 UTC

Bush declares war on freedom of the press
March 6, 2006 07:44 AM / The Rant .

By DOUG THOMPSON

Using many of the questionable surveillance and monitoring techniques that brought both questions and criticism to his administration, President George W. Bush has launched a war against reporters who write stories unfavorable to his actions and is planning to prosecute journalists to make examples of them in his "war on terrorism."

Bush recently directed Attorney General Alberto Gonzales to use "whatever means at your disposal" to wiretap, follow, harass and investigate journalists who have published stories about the administration's illegal use of warrantless wiretaps, use of faulty intelligence and anything else he deems "detrimental to the war on terror."

Reporters for The New York Times, which along with Capitol Hill Blue revealed use of the National Security Agency to monitor phone calls and emails of Americans, say FBI agents have interviewed them and criminal prosecutors at the Justice Department admit they are laying "the groundwork for a grand jury that could lead to criminal charges,"

CIA Director Porter Goss told Congress recently that "it is my aim and it is my hope that we will witness a grand jury investigation with reporters present being asked to reveal who is leaking this information. I believe the safety of this nation and the people of this country deserve nothing less."

As part of the investigation, the Justice Department, Department of Homeland Security and the National Security Agency are wiretapping reporters' phones, following journalists on a daily basis, searching their homes and offices under a USA Patriot Act provision that allows "secret and undisclosed searches" and pouring over financial and travel records of hundreds of Washington-based reporters.

Spokesmen for the Justice Department and Department of Homeland Security admit there are "ongoing investigations" regarding publication of stories "involving threats to national security" but will not reveal what those investigations include.

In addition to using the USA Patriot Act to pry into the lives of journalists, the Justice Department has also dusted off a pre-World War I law to prosecute people who receive classified information, although the law was aimed at military personnel not civilians.

"This is the first administration that I can remember, including Nixon's, that said we need to think about a law that would put journalists who print national security things up in front of grand juries and put them in jail if they don't reveal their sources," says David Gergen, who served as President Regan's director of communication and also worked in the Nixon and Ford White Houses.

Political scientist George Harleigh, who worked in the Nixon administration, says such use of federal law enforcement authority was illegal when Nixon tried it and still so today.

"We're talking about a basic violation of the Constitutional guarantee of a free press as well as a violation of the rights of privacy of American citizens," Harleigh says. "I had hoped we would have learned our lessons from the Nixon era. Sadly, it appears we have not."

In recent weeks, the FBI has issued hundreds of "National Security Letters," directing employers, banks, credit card companies, libraries and other entities to turn over records on reporters. Under the USA Patriot Act, those who must turn over the records are also prohibited from revealing they have done so to the subject of the federal probes.

"The significance of this cannot be overstated," says prominent New York litigator Glenn Greenwald. "In essence, while the President sits in the White House undisturbed after proudly announcing that he has been breaking the law and will continue to do so, his slavish political appointees at the Justice Department are using the mammoth law enforcement powers of the federal government to find and criminally prosecute those who brought this illegal conduct to light.

"This flamboyant use of the forces of criminal prosecution to threaten whistle-blowers and intimidate journalists are nothing more than the naked tactics of street thugs and authoritarian juntas."

Just how widespread, and uncontrolled, this latest government assault has become hit close to home last week when one of the FBI's National Security Letters arrived at the company that hosts the servers for this web site, Capitol Hill Blue.

The letter demanded traffic data, payment records and other information about the web site along with information on me, the publisher.

Now that's a problem. I own the company that hosts Capitol Hill Blue. So, in effect, the feds want me to turn over information on myself and not tell myself that I'm doing it. You'd think they'd know better.

I turned the letter over to my lawyer and told him to send the following message to the feds:

Fuck you. Strong letter to follow.

--Capitol Hill Blue

No, not really.

The Scoreboard: Thursday, March 2
In the demo, MSNBC beat CNN at 7 and 8pm again, and enjoyed an overall primetime win over CNN, as well. FNC averaged over 2 million in primetime and almost 1 million in total day:

25-54 demographic:

Total day: FNC: 263,000 / CNN: 138,000 / MSNBC: 88,000 / HLN: 92,000 / CNBC: 59,000

Prime: FNC: 499,000 / CNN: 152,000 / MSNBC: 184,000 / HLN: 148,000 / CNBC: 71,000

6pm: Hume: 330,000 / Dobbs: 172,000 / Abrams: 131,000 / Mad Money: 87,000

> Paranoid minds want to know!

This is a simple concept that many people don't seem to get.
Information rate directly correlates to bandwidth in this way, higher
rate and more detail means larger bandwidth. Analog or digital is just
a method of encoding information. Narrow filtered analog is similar to
low rate digital. It does not matter what digital method you use you

can't get around the fact that a better picture or audio means you need to use more bandwidth.

There is more then one way to encode the analog world into digital and back and some methods are more efficient then others but there is no magic digital encoding system comprised of one or a combination of encoding methods that will magically stuff more information into the same bandwidth.

The DRM controversy has gone on for a long time where the claim that DRM sounds better then analog in the same bandwidth. This is a bunch of BS. Not only does this violate the laws of physics it further makes less sense from the standpoint of conversion of analog to digital at the transmit end and then digital back to analog at the receive end. Technically changing from analog to digital and back introduces conversion errors so DRM in the same bandwidth has to sound worse than analog. The only way DRM can sound better is to use more bandwidth than analog.

So there are are two basic concepts for anyone reading the news group. DRM and IBOC claims are a bunch of BS. Analog or any digital system will sound better the more bandwidth you use.

Well I for one would appreciate it if you did not use the news group to
bash some of the people that use it for the right reasons. This is a
public forum so you will just have to tolerate on topic dissimilar
opinion.

You indicate a fairly egregious example in your post but I would point
out that it is very unfair of you to paint the people using this news
group with the broad brush of that example.

This a news group and if someone appears disruptive or if the
information they post is suspect for any reason put them in the kill
file. The news group is an information resource on the hobby of short
wave listening and is only as good as the information that is posted.

The buildup of this La Nina was so exceptionally swift and intense
that it was impossible at the moment to infer what the impact would
be, and how long the phenomenon would last, it warned.

"Most models and expert interpretations favour the event dissipating
quite rapidly over the next three to six months," the UN's weather
agency said.

"Nonetheless, neither a continuation of La Nina beyond mid-year, nor
the development of El Nino in the second half of 2006, can be ruled
out as possible outcomes from the current prevailing situation."

> outside their own market area (MSA and embedded metros).

My argument is as follows.

First you must acknowledge that there is a lot (a high percentage) of regional and national commercials on AMBCB.

Second that many stations (a high percentage) carry network programming.

Third that it makes no difference to advertisers whether I listen to a networked program carrying regional and national commercials on AMBCB on a station that is local or distant. I hear the commercial and can respond to the 1-800-number or go to the web site and make a purchase so the advertising does its job either way.

So when I respond to an advertisement who can know what station I heard it on. Do they just make the assumption that it was a local station?

FWIW, here's the schedule to North America from the VOR website. It's
a shadow of it's former self.

http://www.vor.ru/Eng_N_A.htm

And there is the less challenging way with Real Audio.
http://www.vor.ru/wrn.html

I haven't listened in for quite a while, but in the 1980's and early 1990's some of their programming was pretty decent as I remember, as is Radio Cuba. I remember listening to Radio Bulgaria once and thinking this is a throwback to the early days of the cold war!

> Thanks...

Well, the 909 is priced at least 4x the DE1103, so it is kind of an apples and oranges comparision... :-)

The 909 has as the other fellow indicated a lot more features, and they are probably executed a little better than on the DE1103. The DE1103 for it's good points as a receiver has a poorly designed and executed memory setup. And it generates lots of repeat signals.

You might take a look at reviews of the DE1103, Sony 7600 and Sangean 909 on Radiointel and Eham for more details.

>
> First you must acknowledge that there is a lot (a high percentage) of
> regional and national commercials on AMBCB.

Yes, there are lots of companies that advertise in many if not all the rated markets in the US. But when they do, they buy advertising that is priced based on thelocal audience in the metro to which the station is licensed. Very seldom are even adjacent markets where a station may have some listening even taken into consideration. There is no interest in skywave coverage, as most such buys are placed only for 6 AM to 7 PM, and not at night. Most of what you hear at night on AM are bonus spots and PI deals.
>
> Second that many stations (a high percentage) carry network
> programming.

Actually, very few stations carry network programming. And most have the ability to take it a la carte, and run the spots (which are the payment) when4ever they want as long as it is in 6 AM to 7 PM.
>
> Third that it makes no difference to advertisers whether I listen to a

But that is not how advertising is bought. It is bot based on Cost Per Point only in the local market. If there are fringe benefits the advertiser does not pay for them... and, again, nearly all sales are in daylight hours.
>
> So when I respond to an advertisement who can know what station I heard
> it on. Do they just make the assumption that it was a local station?

Yes. Unless it is one of a handful of PI accounts (where a station is paid per inquiry) that use night radio to peddle C. C. Crane Radios and such.

Many blowtorches do, too, on AM/MW. Our KTNQ is only listenable within its
10 mv/m to 12 mv/m contour due to local noise levels in LA. The HD signal
actually covers better than the 10 mv/m analog one does... on a 50 kw AM.

Actually, yes. There is no mechanism by which they can meaningfully track skywave impressions to a message. The numbers are so low as to be statistical zero. So, Arbitron diaries track locally relevant signals. Out of market signals are not even considered unless listening levels become statistically significant. And from my experience, when station manglement has made the trip to actually see the survey diaries personally, they disregarded out of market listening as 1) erroneous reporting, or 2) anomalous reception...either of which gets the out of market station report tossed.

Response to adverisements happens on multiple levels. Your perception of response through sales is correct, but incomplete. Advertisers, and advertising agencies use complex, and sometimes medium/source specific, methods to track advertising. This may be as simple as: "Tell 'em Peter sent you".....to as complex as logged IP addresses connecting to referenced web pages, and tracking cookies. Encoded coupons with tracking data that's correlated to credit card data at POP. Or multiple toll free numbers...one used for each station on the buy. (I was even involved in a campaign where we had a separate toll free number for each daypart at each station...each number active in the local ADI. Out of market responses could not connect to the toll free numbers.) In all cases of my direct experience, less than 10 total out of market reception reports came in. All of them were disregarded as either anomalous and of no consequence, or erroneous and of no value.

There have been isolated cases, however, of non local advertisers buying a station specifically for its reach. In the 60's a motorcycle shop in Tennessee bought WLS, ran only between sunset and sunrise, and did surprisingly well. This went on for years. In the 70's I remember buying tape decks and other components from Playback, in Chicago, in response to advertisements I heard on WLS. I was living in Iowa at the time. First comment, each transaction: "You're in Radio, aren't you?" Apparently, a lot of disc jockeys bought their stereo gear from Playback in response to the spots on WLS. Radio people do NOT get listening credit either in advertising tracking data, or Arbitron.

I remember in high school...WLS overtook KXOK at night among highschoolers in North St Louis County. But advertising had little effect on that listener base. National advertising that generated sales did so locally. And it was assumed that KXOK, later KSLQ, and KSHE, running the same spots, were responsible.

And we all at one time or another listened to Beaker street on KAAY. Though I don't recall any out of market advertising.

KMOX, St Louis also ran spots for out of market advertisers, with similar success to WLS about this time. But, again these were unusual circumstances. And eventually, as skywave listening declined, the practice stopped. In each case, though, these were local advertisers making their own decisions. Today, no agency would make such a buy. Even though the commissions could be considerably higher on a highly rated major market station.

Network programming...yes many stations carry it. But usually, a station can locally be found to carry the program of interest. And its advertising. In cases where a local affiliate can't be found, out of market listening is not a consideration. And again, there is no effective way of tracking it. Nor any compelling motivation to make the effort for a statistical zero. Not that it doesn't happen. But statistically, it's below the noise floor.

So, there is no real motivation to consider the DX audience. Fringe, yes, or maybe. Skywave, no. Because there is no significance to the advertising effectiveness of skywave listening--there's no money in it.

If there were a dollar to be made....believe me Radio would claw each other's eyes out to snap it up, and do whatever it takes to generate it.

But until there is...there's no reason for Radio to give it a first thought, much less a second.

>
> Oh yes : I need to try the snake-in-the-attic antenna as well...

The impedance ratio of your transformer is 50 ohms to 800 ohms.

p= primary
s=secondary

Turns p/Turns s = the square root of (impedance p / impedance s)
so
2/8= square root(50/s)
800 = s

The turns ratio is 1:4 and the impedance ratio is 1:16. In other words the impedance ratio is the square of the turns ratio. This is a little high and I would go for more like turns ratio 1:3 for impedance ratio of 1:9, which would be 50 ohms : 450 ohms. For example you could use 3 turns primary and 9 turns secondary.

The sloping wire characteristic impedance will change with the height above ground so I expect that you would want an impedance number at the coax/wire junction.

The core will have a frequency range it will work over so test it at three places. Test it at the lowest, highest and some place in the middle of the intended frequency range. You may find the response falls off on the low or the high end. When you do this wind the primary and secondary apart from each other so you get the core response.

When you are done testing the core range wind them together so the two windings couple better enhancing whatever coupling the core is providing for you.

I heard classical music on that frequency from about 05:30 to 06:00 UTC
last evening. The transmission ended at 06:00 UTC. During that time I
could hear RCI under the music fading in and out.

I believe I heard "Radio Exterior De Espana" (Spain) at the 06:00 sign
off. They spoke fast and I don't know spanish or other languages so I
can't swear to it.

Good signal though.

There is no place in Reno that I know of that sells higher end shortwave (I lived there a while ago). There used to be a place on Mill St. just east of 395 but that is closed down I believe. Circuit City may carry the Eton. You may have to research on the internet and find a good on-line store to purchase from, like Universal or Grove Enterprises.

I have bought most of my radios at Universal in Ohio. Find what you want
on their web site and call them up and order over the phone.
New and used equipment <http://www.universal-radio.com/>

There are other places on the web you can shop like Grove.

During the solar minimum period the low bands (from about 5-6 MHz and
down), including the MW BCB and LF beacons, are at their peak for DXing.
The rest of this winter and next winter will provide the best low band DXing
opportunities until the next solar minimum 11 years from now. Take
advantage of it!

Yes, post loads! However, be aware of the fact that Mike Terry just might lift the items that YOU post here (or elsewhere) and post them somewhere else without attribution, indicating that he either found the info on his own or he heard it on his own.

It's his modus operandi. I've caught him doing this several times (in fact, I just caught him doing it again this afternoon). Andy Sennitt (formerly with the WRTH and now with Radio Netherlands) has caught him doing this as well, as have others over the years.

Well, I guess I'm an odd duck when it comes to radio. I spend most of my time listening to the out of the market area. I live in Ventura but listen to stations up and down the coast because they carry programming I can't get locally. For example on a regular basis I listen to KFI, KNX and KABC in LA, KOGO in San Diego, KGO in San Francisco, KOH in Reno Nevada to name just a few. Locally I only listen to KVTA in Ventura for AMBCB.

I listen to AMBCB for similar reasons as I listen to short wave, news and information. Short wave is a larger scope of world events.

If I want music in the car its classical music on one of several public service stations or the one commercial station in LA, KMZT FM 105.1.

Usually I hear on the national advertising that the show host has you enter their name on a web page or tell the phone operator their name when placing an order so you get a special discount or extra.

The list of stuff I hear advertised on AMBCB nationally is nearly endless as I listen to several syndicated talk show host programs. This is the majority of my AMBCB listening. The exception would be KNX, which is news/talk/weather most of the time. They have some local programming at times but I don't listen to it.

So that me spending most of my AMBCB listening time to syndicated national talk/news/business information radio with a good percentage of commercials broadcast to the national audience and the rest local injected by the station to which I'm currently listening.

Usually I can get a syndicated program on several stations and I pick the one that has the least annoying local commercials. Kind of a funny reason to determine which station I listen too. On KVTA there is local jewelry dealer and a BMW dealer whose commercials I just can't stand at all so I'll switch to another more distant station to hear the same program.

This just means that the lower bands will be better than the upper
bands. The international broadcasters change the frequencies they
broadcast on seasonally and yearly based in part on the sun spot count
so it should not affect your listening to a large extent.

They smaller broadcasters are not as flexible though so you might lose
out there during the minimum sun spot years.

Those 800 number ads are seldom paid commercials. They are paid for based on the number of calls, which is often zero... but they run in times where the station has nothing salable so there is some gain. You will find them used as filler in syndicated shows, which have commercial windows. The syndicator puts these spots in, and if the station has no better spots (sold ones) they run as fill. This is like the 800 adds on cable TV. If the local cable system has paid ads, they superimpose them. Otherwise, they make a few cents on the "100 Greatest Hymns" collection.

Peter is a pro, and generally more patient than I am (er, ah, well...) and
always has interesting points of view. Thanks for the comment. All in all,
there is essentially no strong revenue stream for AM radio after 7 or 8 PM
unless there is play by play sports.

It looks like the best of the best frequent here, but apparently have some long-fermented disagreements.Is there a mod here that can post topics,and keep things in line? Glenn Hauser would never allow these bickerings at ODXA.

Actually, the way those syndicated shows are sold to advertisers is by market penetration. The syndicator picks off several minutes an hour in the show that they sell, and in exchange, the station gets nearly all shows for free. The syndicator has a list of markets, and sells based on the total market by market reach. The advertiser is buying 50 or 100 or 300 markets, not "national coverage." A syndicated night show is rough as few advertisers buy radio at night. This is why often stations rerun daytime shows at night.

The syndicator's profit comes 100% from the sale of the spot inventory, except for a few big shows like Rush which also get paid cash from the stations.

This is the sad truth, but it doesn't make things any better for MW DXers.Us hobbyists have to stop wasting time with lamentations, though, and get the radio turned on and see what IS out there now free for the taking.

> side by side on shortwave?...

Performance on both is good, but for the price/performance ratio, the DE1103 is the real bargain. I've tried both, only off the whip, and I actually found the 1103 to be more sensitive than the 909 on some frequencies during my albeit-limited comparison time. The only thing I really don't like about the DE1103 is its freakish volume control ergonomics; just a really poor design. The fake 'analog' LED takes up a lot of real estate and I don't bother to look at it... I would have designed this radio differently, but the main point of the 1103 is that it is a real gem for the price when it comes to performance.

I was never particularly impressed with the sensitivity of the '909 off the whip. That said, I believe that, compared with many other portables. the '909 is a tad more immune to overload when used with an external antenna...and that can be a major plus.

Thanks John. I love hearing stories about past dx. I started listening
back in the late 60's. 1967-70 were the first particularly good years
I recall. I had a number of radios that I hacked together to receive
those classic cold war broadcasts. I was probably 11 or 12 years old
when I started collecting old tube radios. I don't know how I avoided
getting electrocuted but I guess my father taught me enough and I was
always reading old radio magazines.

Most power companies are responsive to noise complaints -- as often it means
leakage and wasted power or an impending failure.

It's interesting how many people focus on a different feature of the
DE103 to complain about but we all like it's basic performance. For me
it is a memory that uses base 16 to number channnels and memory
firmware that is seriously buggy.

Hmn, I have to admit I haven't had any issues with memories or firmware with this model, but then again I rarely make use of the memory functions of any of my shortwave receivers. Now I am curious... what's buggy about the memory firmware of the 1103?

> expect for the next ~11 years?

There are three cyclic things I can think of that affect propagation.

1. The night and day cycle.
2. The winter and summer cycle.
3. The solar minimum and maximum cycle.

All three are similar in a way in that the propagation is affected by the amount of sunlight in the hemisphere you reside in.

Basically the 11 year cycle will exaggerate the night/day and seasonal effects in a way similar to the tides where when the moon and sun gravitational pulls line up you have the same tide cycle but the levels change is more dramatic.

Right now we are at or near solar minimum and so the lower bands are generally better with over all lower levels of solar ionization. As the time of day and season favor the lower bands they will be even better at these times than during the solar maximum.

Consequently high band propagation is not as good. The current daytime MUF is not so high this past the winter but was higher this past summer. The daytime MUF will be higher in the solar max winter than this past winter and even higher in the solar max summer than this past summer.

Over all, low bands are better these days and higher bands not so good. During solar maximum the low bands will not be so good and the high bands will be much better when the season and time of day favor them.

The change in middle bands will not be as great as in the low and high bands going from solar min to max.

That's a tall order Lisa, but in general as the next sunspot cycle begins, the 'solar flux' (energy measured at 2800-Mhz or 10.7-cm wavelength) will gradually increase over a period of several years. At the minimum of the cycle such as now, the flux is averaging in the 70-80 range. The flux has dropped into the 60's in some past cycles. At solar maximum the flux can reach 300. This causes the ionosphere to become more energized and able to support the propagation of higher frequencies in the day and well after sunset too. The 17-m and 19-m bands can be active all night during solar maximum, whereas now they drop out shortly after sunset because the ionosphere isn't receiving enough energy during the day to keep it active at night. The ionosphere is a huge cloud of electrically charged ions (charged atoms) which surrounds the earth above the lower atmosphere. The sun supplys the energy during the day which keeps the ions separate from electrons. This condition is necessary to support the propagation (refraction) of radio energy. At night the ions and electrons slowly recombine into neutral atoms which do not support radio propagation. Of course the sun is always shining on half the earth so this process is going on all the time somewhere in the ionosphere.
The down side to a more active sun during the maximum of the cycle is an increase in solar storms which can emit high energy particles and radiation. This can wreck havoc with the ionosphere, making it effectively useless for radio propagation for hours or even days.
Sunspots have been seen by man for at least a thousand years, probably much longer. Scientists have been studying the sunspot cycle since the middle of the 18th century. We are currently experiencing a quite sun at the end of cycle-23 which began in May-1996. The first signs of cycle-24 will be the appearance of sunspots at low latitudes near the sun's equator. These will gradually expand towards the higher latitudes as the cycle progresses. The sunspot cycle is driven by the dynamics of the sun's magnetic properties. You might enjoy reading more about it at the following website.

http://www.windows.ucar.edu/tour/link=/sun/atmosphere/sunspots.html

Those old Grundig radios were pretty cool. I've got a Satellit 650
Professional.....I measured the MDS at .1uV. The Satellit 210 and
the Satellit 3400 measured at .3uv, using the same test setup.
All of the dual-conversion models were good, though.

Unfortunately, you'll have to rely on ebay to get a SW radio these days. The last ham radio store in Sacramento, a much bigger city, closed years ago. The Ham Radio Outlet stores in the SF and LA areas now serve the entire western US. Besides, buying a radio direct from China saves you a ton of money. Look for liypn's V-COM-COLLECTIONS ebay store, you can find Degens and Tecsuns there. Best is a tie between the Degen 1102 and the 1103, it's really a matter of personal preference since they perform about the same. If you truly want a tabletop, you can get used Icoms on ebay for a few hundred bucks. Drakes get bid up too high. There are very few tabletops being made new, and those that are cost $1500 or more. If you want a tabletop, your best bet is to look for Icoms on ebay, search for "Icom receiver". Some of the entries will show the radio on a red velvet background, those are listings from Martyn who calls himself radio-mart who is a fraudulent seller. Avoid radio-mart at all costs.

Hi all, Me again (Mr Thick)

As you all probably know I am still relatively new to SW.
so please bear with me.
I have a Sony SW77 as my Portable (well sort of portable-ish)
and I have the Icom R72 as my main house radio.
I also have an old Sony 7600D (known in the USA as the Sony ICF2003) which i
find excellent, believe it or not :-)

I have been looking at both the degan 1103 and the Sangean 909.
Against the radios I already have, do you think I would benefit at all from
getting either one or even both the aforementioned radio's
regards
Rikk

I have received this email from someone who I have had quite a lot of dealings with on ebay. I have always found her to be honest and reliable. At first I was very sceptical, but after reading the email I thought, why not? I will give it a go. For years I have wasted what must be by now be hundreds of pounds on the Lotto, I have never even won a tenner!!!! All I have to lose by taking part in this is £3!!! If everyone takes the same point of view, we can't lose.

PLEASE READ ON!!!!!

As we have communicated during the past through Ebay/PayPal, or mutual friends,
I thought you might be interested in this 'cash generation' opportunity. If you find this email offensive in any way, please delete it and accept my sincere apologies for sending to you.

This e-mail is going round paypal and ebay users and it seems to be working. Yes, it is a pyramid selling/multi-layer marketing process, but with a downside risk of only £3.00 and large potential gains, it seems to me to be worth a try!!

Please do not delete this before reading it in full - it is not a scam and is not junk mail! Please note from my eBay feedback that I am a genuine seller/buyer on ebay and PayPal and a real genuine person hoping to earn some cash.

You, like me, have no doubt had a similar idea presented to you before, but not in connection with 78 million Paypal accounts. Paypal have also admitted that this is legal and trading standards are not aware of any problem.

The person who sent me the email has already started benefiting from the plan. All it involves is a one off initial payment of £3.00 and approximately 30 minutes of your time. These are some of the e-mails and proof that I came across which finally made me decide that I wanted to try this.

"What an amazing plan. I followed the instructions just 3 weeks ago, and
although I haven't made 10 grand yet, I am already up to £6,135. Am absolutely gob smacked" - Alan Humphries, Leicester

"Well what can I say? I sent out 40 e-mails like the plan said then just
forgot about the whole thing. To be honest, I didn't really think anything
would come of it, but I checked my Paypal account a week later and

there was
over £3000.00 in it!!! After 30 days I now have over £11,000 to
spend" Lisa
McDonald, Northampton

"I was shocked when I saw how much money came flooding into my Paypal
account. Within 3 weeks my account balance has ballooned to £7,449. At
first
I thought there had been some kind of error!" - Richard Barrie,
Cirencester

"I was very sceptical when I first read this e-mail, nearly deleted it
but
then I thought about it & decided to give it a go! Some people spend
more
than £3 per week on the lottery, so what's a one-off payment of £3
going to
matter?!! I've got my fingers crossed that I'll have some extra
spending
money in my paypal account very soon!!,

The problem with these type of schemes is that usually they run out of
people to pass on to - but with 78 million users and more joining every
day, how likely is that? Plus, they usually require high investment -
this doesn't.

If you are eager like I am by this stage, then please read the
instructions outlined below. It is really so easy to do - then you can
just sit back and wait for those payments to go into your paypal
account.

INSTRUCTIONS

The first thing you need to do is send a £3.00 payment from your
Paypal account to the FIRST email address in the list below, along with
a note saying "PLEASE ADD ME TO YOUR LIST". You will also have to
select a Subject; Service or Goods other should be fine. Instructions
on how to send a payment are under "SEND MONEY" at the Paypal site. It
is very easy. The current list is:

1 gumbies2000@hotmail.com

2 kyliejacques@blueyonder.co.uk

3 nicola@ashton2602.f2s.com

4 puffyj69@hotmail.com

5 robbins1940@aol.com

Copy and paste this page (and make any necessary changes) Remove the
email
address that you have paid from the number 1 spot, move all the others
up a space, and insert your own email address in

the number 5 spot. make sure that you spell it correctly and delete the first email

Then send the page to as many people as you can. A good way is to send it to all the people in your paypal history.

(GO TO HISTORY TAB ON PAYPAL AND THEN 'DOWNLOAD HISTORY' FOR COMPLETE LIST OF PEOPLE YOU HAVE TRADED WITH)

ALL I WOULD LIKE TO DO NOW IS WISH YOU GOOD LUCK. IF YOU ARE STILL UNSURE OR EVEN IF YOU WOULD JUST LIKE TO KNOW HOW THIS WORKS PLEASE READ ON.

HERE'S HOW IT WORKS:

When you send out your email, your email address will initially be at No 5 on the list. That is the best position that you can be in if you want to earn serious money.

The response rate for this program is much higher than any typical email marketing campaign for a number of reasons, which are explained later on.

As long as you send out your emails to people whom are likely to be interested in this program, then on average you can expect a response of around 25%. But let's be extremely conservative and assume that the

average response rate is 12.5%!

If you send out your 40 emails, you can expect at least 5 of those people to do exactly what you did (12.5% of 40 = 5 people). By the time your email address will have moved up to No 4 in the list, and this list will now have reached around 200 people (5 people x 40 emails = 200 people).

Out of those 200 people, you can expect at least 25 of them to participate(12.5% of 200 = 25 people) so you are now reaching around 1000 people (25 people x 40 emails = 1000) and you are now at No 3 on the list.

Out of those 1000 people, you can expect at least 125 of them to participate (12.5% of 1000 = 125 people) so you are now reaching around 5000 people (125 people x 40 emails = 5000) and you are now at No 2 on the list.

Out of those 5000 people, you can expect at least 625 of them to participate (12.5% of 5000 = 625

people) so you are now reaching around 25000 people (625 people x 40 emails = 25000) and you are now at No 1 on the list.

Out of 25000 people, you can expect at least 3125 of them to participate (12.5% of 25000 = 3125 people) so since you are at the No 1 spot you can expect to receive around about £9,375 (3125 people x £3.00 = £9,375)

So when your name hit's the No 1 spot, it will be YOUR turn to collect the money.

Over the course of 30 days, this money will be sent to you by a few thousand people just like yourself, who are willing to invest £3.00 and 30 minutes of their time to receive around £10,000 or more in cash.

The first payments will arrive within a few days and then they will continue at the rate of about 100 payments per day for about 30 days (obviously this will depend on how quickly you act and how quickly people take you up on this offer and then

pass it on).

After that time, the volume of payments begins to taper off as your email is removed from the No 1 position. That's all you need to do! There will be around £10,000 in £3.00 payments waiting for you in your Paypal account within the next few weeks. £10,000 for just 30 minutes work! This is real money that you can spend on anything you wish! Just deposit it to your own bank account or spend it directly from your Paypal account!!!

It's just that easy!!! I think it's worth it, don't you?

Remember, the 12.5% example above is assuming that 35 out of the 40 people you send your email to will do absolutely nothing except delete your email. However, if you follow the plan correctly and send your emails only to people who are likely to want to participate, you can expect a typical response-rate of around 25%. Hence, the 12.5% example is only given as a worst-case-scenario.

Additionally, the above example assumes that each participant will only

send out 40 emails. Imagine what would happen if each participant sent out 1,000 emails instead of just 40! Believe me; many people will do this and much more!

Unlike many other MLM programs, this 5-LEVEL PROGRAM costs you only £3.00
which is much more realistic and provides much, much faster results. Only the first person on the list gets your £3.00 gift, but everyone in the list will rise to that Number 1 position as thousands of emails are being sent out. No cheating can occur (don't be fooled by claims that this system can be cheated) as Paypal only allows one account per person.

Because it is so easy, the response rate is VERY HIGH and VERY FAST (Internet email FAST), and you will start seeing dramatic results in less than one week!

Thank you and good luck in your ventures.

HAVE JUST PAID MY 3 POUNDS TO THE ORIGINAL FIRST EMAIL AND IT DOES MAKE SENSE AND WHAT THE HECK AS NEED TO PAY THE RENT

The fact is, if you got one or more folks who really refuse to stay on topic, there ain't a thing you can do about it short of getting yourself a moderator. That sucks, but dems da facts. You can ask off-topic posters to stay on topic, but in some cases they don't give a rats ass about the group, its topic or its other readers. In those cases you're just plain outa luck.

> firmware of the 1103?
>
> Jackie

Here's my take.

First off the memories are numbered using base 16 so keeping track of specific stations and allocating groups of memories to bands is difficult at best unless you can count in hexadecimal. Additionally of the hexadecimal memories can't be accessed using keypad entry because they include numeric and alpha characters.

The firmware bug involves transferring a station from memory to the current band. Each band has a memory channel that makes it easy to flip between a program on AM 740 to FM 88.5 to shortwave 3965 to shortwave 9580, etc., by using the band switch. If you transfer one station from main memory (256 slots) to a band memory it transfers the highest frequency stored for other bands at the same time.

For example, assume I was listening to AM 740 and FM 88.5 and had those frequencies plus AM 1500 and FM 107.3 stored in memory. If I transfer AM 1500 to the band memory the firmware also transfers 107.3 to the FM band at the same time. It's really irritating and comes close to defeating the usefulness of 256 memories.

I've managed to get used to the multipurpose wheel used for volume control. I really can't get over how much space is wasted with the digital/analog frequency display. I think the space occupied by the analog dial could have been put to better use as a larger numeric display with full time clock and a properly aligned keypad.

All that said, I do enjoy using that $60.00 radio because it does catch radio signals well.

First off, congratulations on owning the 7600D, which is I think a classic digital radio. I wore out the tuning buttons on it's look-alike predecessor, the ICF2002. :-)

Assuming your current radios all work, they would seem to cover the range in terms of frequencies, features and portability. I don't think you will gain anything in performance by switching to a DE1103 or ATS909. That said, we are all afflicted by GAS (Gear Acquisition Syndrome) at one time or another, so I can empathize. Sometimes the only cure is to give in and try that new radio!

Another question please... Will a 2 / 6 turns balun behave the same as a 3 / 9 turns balun ?

I suspect not, but what will be the difference ?

Thanks again for teaching a newbie...

Charly

Message-ID: <1141759133.839350.201000@p10g2000cwp.googlegroups.com>
Source record: 66357

The major problem is that so many parents refuse to take responsibility for their childrens' well-being, education and behavior. I see it every damn day, and my wife, as a schoolteacher, is charged with solving the problems the parents create. The parents ignore their kids eyes and ears, plop 'em in front of a TV instead of reading to them and interacting constructively with them, teaching them right from wrong and shoing them how to get ahead in life...and then they get mad when their kid can't see, hear, read or behave properly. Maybe having the state become daycare for kids isn't the right answer, but until people are taught not to pump out millions of hungry mouths and TV-induced IQ-impaired ADD cases until they are ready to shoulder the responsibility, we taxpayers are gonna get screwed one way or the other.

Rob Reiner isn't the villain here - it is the globs of retards who insist on passing on their brilliance to their children. He may be adding fuel, but the fire is already lit.

< Snip >

The impedance of the wire will change with its height above ground. You
are trying to transform that impedance to that of the coax.

Basically the higher the wire the higher the impedance. Smaller diameter
wire for the same height will be higher in impedance.

< Snip >

In a voltage type transformer the impedance and resulting
voltage/current changes are based on the ratio of the windings. The core
and number of turns in the windings change the inductance of the primary
and secondary windings and the mutual inductance between them.

You are trying to make an RF voltage type so generally shorter windings
are better so go with the minimum turns to get the ratio you want.

2/6 and 3/9 are both 1:3 winding ratio so the impedance transformation
is the same. The impedance conversion is 1:9 so 50 ohms : 450 ohms.

The mutual inductance between the windings will be greater with the 3/9.

I just met with a lineman from Pedernales Electric company. I invited him in to listen to the buzz on my FT101 as I explained to him that I was a licensed amateur radio operator, and he promptly told me what a pain in the ass hams are to them - but it said it all in fun. I then told him how I ruled out any source coming from my home by turning off the mains. He also let me show him how the noise source came through loudest on a portable AM radio when we walked underneath the powerline next to my home.

He was actually pretty cool and receptive to all the evidence and suggestions I offered. I was able to convince him that the source of the RFI is coming from their equipment. That much was easy. The guy actually wants to help me eliminate the source.

The next problem lies with this power company's experience/ability handling these types of issues. The guy didn't have any RF experience and really didn't act like he knew what to do next. For now we agreed to have someone come out later with a mini cheery picker for a close inspection on the power pole in my backyard and everything mounted on it. We both agreed on

what to look for - loose nuts, bolts, staples, bad insulation, bad lightning arrestors, etc. I can only hope they will find the source - but I doubt it.

I told him about how, with the portable AM radio, I could pick up the same noise a 100 yards or so down the same line (away from the pole in my backyard). We both know that the source of this RFI could be coming from several different places along 6 or so poles.

I know that the easier it is for these guys to find it, the easier it will be for me to get cooperation and the quicker I'll be done with this crap. I offered the guy help from any local hams or anyone else who might have direction finding skills and he was all for it! Now I just need to find someone like that to lend us a hand. I'm trying to find someone now.

You can walk around under and around the poles to find the place where
the noise is the loudest.

You might be able to use the null in the portable radio internal loop
antenna to point at the source. You can triangulate on the noise source
by nulling it from different locations around the neighborhood.

I believe Ascension is owned by Merlin Communications. It always comes
in strong in North America. The BBCWS English service to Africa via
Ascension at 0400 on 6005 is sometimes strong enough to interfere with
Cuba on 6000 here in California.

> I have been looking at both the degan 1103 and the Sangean 909.
> Against the radios I already have, do you think I would benefit at all from
> getting either one or even both the aforementioned radio's

Frankly, no.

In my opinion, both would be inferior to what you already have.

Should you really want a newer small portable, you might consider the
Sony ICF-SW7600GR, but I don't think even that will offer you much more
in performance than what you already have. As for your other two, no
matter what you spend on new receivers, you won't hear any more
stations than what those can hear.

If you really want to improve your listening, experiment with different
and possibly better antennas for your various radios. Remember - it's
the antenna that brings in the signal and the best radio in the world
is worthless with an inadequate antenna.

Best,

Joe

Telamon -

Can you please explain mutual inductance? Is that like coupling
coeficcient <sp>?

If we short one winding out and measure the other winding's inductance
then we will have a measure of the coupling between the two coils. The
lower the inductance measured then the lower the stray inductance - or
supposedly the better the coupling. With fewer turns then I think
maybe the lower the stray leakage we will measure.

Am I on the right track?

I think the balun design can use the very small cores as long as we
dont want to transmit. Correct? I am thinking that since the voltage
we will see across the coil In receive mode is microvolts then we don't
have to worry too much about wasting power magnitizing the core. So
then use only a very small number of turns.

I have to build a balun too for a T2FD I am putting in the attic. I
have Doug DeMaw's ferrite design book that I will open tonight when I
get home.

Not so many good places to find info on receive baluns on www.

regards,
Bob

Not a bad idea at all. I just couldn't be home all day to wait for them. :(

If I had my way, I'd be in all the neighbors' backyards with that radio
looking for the noise. - but I might get shot.

> Ventura for AMBCB.
>

Interesting coincidence, that. I was the voice of KVTA for a number
of years.

There is a difference between fringe listening, and out of market
DXing. Fringe listening happens around nearly all large markets. And
where there is a substantial statistically significant signal, there is
actually ratings data collected about the fringe audience. WLS used to

show up when I was programming the station in Decatur. There were only 4 stations native to Decatur, after all. In fact, KSD, St Louis also showed up in the Decatur book from time to time. Interestingly KMOX did not, but WGN did also. WBBM has a large downstate following. And also shows up in the books occasionally.

I worked at a couple of blowtorches down south before returning to Chicago. It was great experience. And we had coverage in 38 states. Ownership was very accessible, so there were some very protracted conversations about how we might turn that reach into something more than wasted electricity. The primary partner was a jock himself, who grew up listening to the stations while touring as a swing band musician, so he understood the concept of out of market listening, and long distance reach. But neither he, nor the sales staff, which actually sold baggies of tire air from Bob Will's station wagon could never find a way to tap the DX audience. No agency wanted to hear it. No local direct client understood the benefit. Truth is, the numbers said there wasn't any.

Advertising buys aren't based on such data. The figures are particularly small. WGN, WLS, WBBM, when they did show up weren't even also rans compared to the native signals. So, again, if you responded to a spot on WBBM and made a purchase, it was assumed that WSOY was the carrier that made the impression.

Consider the Shortwave audience. That's virtually entirely a DX audience, and numbers can be humongous. BBC was estimating 130 million cume in 1990. All expense. No return. And no way to contribute to operating costs with receiver licenses. DRM, and Worldspace, though can change THAT. Or consider the case of WNYW, Radio New York Worldwide. IIRC, that was Bonneville. A commercial shortwave station. A CBS affiliate and they ran a full boat of commercials. With an audience that spanned two hemispheres. A TREMENDOUS radio station that was as solid and entertaining to listen to as any ever on the dial. But there was no way to independently measure the audience. Radio sales at the time weren't nearly as scientific as the are today, so a buy that was accompanied by an uptick in local sales could be credited with the gain. Trouble is that national/international product marketing is the trickiest of businesses. Products are sold locally. Listening, especially to shortwave, is scattered over a wide area. Often with only a few listener impressions in hundreds of square miles. So, purchases in some regions may require quite the drive to find the product. With many practical limitations to making the trip. Coca-Cola isn't going to pay National network rates on a shortwave radio station for a spot that may produce a sale of one or two cases in South Fox Crotch, Rhodesia. Or East Weasel Penis Portugal. Getting the name out is one thing. And with WNYW's reach, getting the name out is certainly a cake walk. But marketing to actually spur sales would have to be done locally. Starting with making the product available, and known to the locals en masse.

So, here you have a case of worldwide reach and tremendous audience potential, but absolutely no way to sell it.

So it is with AMBCB DX. Huge reach, but no way to sell it. So they don't. Marketing is done locally. With regional or national support, but the buy is made with direct measurable impressions in mind. And on radio stations that have local reach in markets where the product is available. Even national buys are made only when the product is marketed nationally. No sense paying for reach where product can't be sold. So there are very few products that are actually advertised nationally. Many, many more are advertised regionally, and locally, with marketing presence built up locally. The wider area is only support for the local marketing effort. Because sales are local.

If I do a spot for Toyota Trucks that runs throughout the Gulf States, the buy is specifically targeted in markets where there are active, and participating Toyota Truck dealers. And that's not every market in a region, surprisingly. And stations are not bought based on their skywave reach. They're bought based on the local ratings in their ADI. Because if an impression produces a sale, the truck is going to be bought locally. The buy may be regional, but the spots are still targeted for the benefit of local retailers. Local sales. A regional buy only exists to support the local marketing effort.

So, because reach beyond the fringe has not been demostrated to be of saleable value, it's not considered a benefit to the advertiser. If it's not a benefit to the advertiser, it's of no value to the station and those listeners are orphaned. No one cares if they can hear the station or not.

A whole block of St Louis Cardinals fans, those ex-pat St Louisans listening to KMOX's enormous signal for their Red Birds fix, have been literally cut off from the slip stream by the move of the Cards from KMOX to KTRS down the dial. KTRS has the second worst signal in the St Louis area, and the worst night signal since KWK's single site decades ago. That means thousands of listeners will no longer have the convenience of a strong signal carrying the game when they want their Cardinals fix. Both at great distances and right there in the St Louis area. The solution is to fill the coverage map with local FM's in and around St Louis and expand the Cardinals network throughout Missouri and Illinois, Arkansas and, I believe, Iowa. Most of them smaller signals, most FM. All local. And none of them permitting the reach from Phoenix to Puxutawney that would put Cardinals fans back within earshot of their team.

Why did the Cards make this move? Because KTRS made them a significant offer in increased rights fees, and a 50% interest in the station. In other words, they abandoned the blowtorch signal for what they believed were better and more saleable options locally. Because the huge reach of KMOX was of no saleable value, it wasn't considered. (The wisdom of selling an inferiour signal against the hired assassins at KMOX is a discussion for another time.)

While the Cardinals acknowledge that they have fans over the much
wider area, the coverage is only useful if it's saleable. And
advertising buys are local. Based on coverage, and audience in the ADI.
DX is of no saleable interest. Cardinals fans orphaned by the deal have
XM as an option. And the Cardinals have entered into an agreement with
XM for their own outlet on the service. This in addition to MLB's
contract with XM. Why? Because there's money in it. XM is a subscription
service. There is advertising, yes. But the advertising/sales model of
XM/Sirius is still evolving. And with Karmazin in one of the big chairs,
you can bet there will be saleable commodities on both XM and Sirius.
But, for now, again, the issue for the Cards is not reach. But
subscription royalties. In other words, revenue.

That's part of the tracking strategy. And it's not just national. A
lot of the stations here refer to webpages where a listener clicks on
the 'radio' icon and enters the name of the host, as well.

> The list of stuff I hear advertised on AMBCB nationally is nearly

Look this one up, if you don't believe me. Physical Searches (ala
Aldrich Ames) were legal when Clinton searched his house. Further,
Clinton signed the bill that closed that loophole. He's still a jerk,
but facts is facts.

Reno and Vegas are at opposite ends of Nevada. Even if he had to go to the HRO in Sunnyvale (Silicon Valley) he'd still be a couple hundred miles closer to Reno than if he went to Vegas. I wouldn't recommend driving to the Bay Area in winter weather from Reno, especially going over the mountains. It's been snowing for a week straight up there. It would probably be easier to use ebay.

I often see it written as VT/Merlin or VT Merlin. If they've dropped the
"Merlin", I was unaware of it.

How come people never used to be this stupid? It seems like people always took time to raise their kids right in the past, even when they were working on the farm from sunup to sundown, or laboring in the factories from 7am to 7pm 7 days a week. Yes, it's tough to survive on minimum wage, but that's no excuse for letting TV raise your kids. A couple years ago in Sacramento authorities found two kids who had been shaken to death by their mother. They were sitting strapped into soiled car seats in a fourplex unit with no air conditioning during summertime (it was 95 degrees INSIDE), with garbage and dirty diapers piled up and household chemicals stored next to baby food. The family couldn't afford electricity or garbage service, the father had been fired from Target for embezzling $1600, yet they had three kids to take care of. The mother just snapped one day. Everybody was outraged, on a local web board people were saying why should stupid people be allowed to have kids. It's not just poverty, poor kids were never this bad in the past. It seems that our society is going backwards, and by 2050 we will be a third world nation while China will be a first world nation.

1124. Opinions on Eton E5/Sangean ATS-505 or PT80

Newsgroup: rec.radio.shortwave
Date: 2006-03-08 02:05:59 UTC
From: Duper <Duper.24bzly@news.radiobanter.com>
Message-ID: <Duper.24bzly@news.radiobanter.com>
Source record: 66518

Hello, this is my first post. I have recently purchased an Eton E10 and like it very much. My choices for new radios is rather limited here in Ottawa, Canada as there are not many local retailers carrying shortwave radios.

I am interested in acquiring a radio with SSB and I should be able to pick up an E5 in a few short weeks from my local "The Source" (Radio Shack was rebranded in Canada recently). The E5 is supposed to be available in early April.

I have read the limited reviews there are of the E5 and was wondering if anyone has some real time experience with an E5. My other choice was to perhaps order a Sangean ATS-505 or maybe a PT80 from a retailer near Toronto and pay the shipping. The problem is I have never actually "seen" either of these models.

If you have any thoughts on the ATS-505 or PT80 those would be appreciated.

Why not use mailorder?

Radiointel.com is a great site for shortwave receiver reviews. Many of
their reviews point out the similarities and differences with other
radios in the same class. eham.net also has lots of user-submitted
reviews.

I have an E5, and I got it from universal-radio.com in mid-February. I
like it except for the lack of sync detect to combat fading signals.
The tuning knob is really nice in the shortwave bands, the ssb is clear
(unlike the Kaito 1102 where the ssb is a bit warbled), and the
operation of the station memories is quite intuitive. But it is
expensive considering the features it doesn't have.

For One and All,

QUESTION - Does anyone know of any specific type
of RF Sniffer equipment that Power Companies use
to locate RF Noise Sources on their Power Poles ???

The may be RadioTexMex could suggest that his local
Power Company find/buy one and use it to Help Eliminate
Customer related RF Noise Sources Complaints from
their Power Poles and Equipment.

hey it's just an idea - iane ~ RHF

> Careful...now you're affecting MY revenue stream. :)

Sorry about that but the banjo and Georges squeaky voice has got to go.
The BMW dealer in Camarillo needs background music in the commercial
that is not so annoying.

I lived in this area since 1979 and I may have heard you on KVTA.
However, the area stations have switched formats over time so I may not
have listened to you if it was a music format but if you did news/talk
format I may have listened to you. If you dont mind what was your on air
name?

By the way, Dave Ciniero of "Dave and Bob" died recently right after Bob
retired so the morning show is all new people now.

Thanks for taking the time to write these examples of revenue streams
generated by local advertising. I understand that the local brick and
mortar stores will only consider the local population coming to their
store.

I was thinking of a virtual market example making the point of sale a
1-800-number and credit card or on-line with a computer and the product
would be shipped UPS / FedEx / US mail. If I understand your examples
even in this virtual sales situation, the marketing is still only
considered locally no different from a brick and mortar store. I hear
advertising on WWCR that sells product this way though.

But what I missed apparently is how the market is determined, which
according to you is only the local population in the strong signal area
combined with a market share number so the number of people listening to
the commercial can be determined. I guess you cannot have the marketing
department making a million long distance calls to figure out how many
people are listening to a distant signal. I guess relying on the people
buying the advertising on the station giving the station their sales
figures would be out of the question and so AMBCB stations rely on an
independent market share survey method.

www.google.com Electric Power Companies Radio Frequency Noise
Sources

I dont know,I think most electric power companies are more interested in
delivering the electric power to wherever it is suppose to go than
hunting down sources of radio frequency inteference.
I wonder if it could be something to do with some faulty phone equipment
up there on those poles?

I'm surprised that Seeing Eye Dog hasn't mentioned this. BBCWS had a segment tonight (morning UTC) on how China is illegally extracting oil and gas from a field in the China Sea that is claimed by both China and Japan. China is patrolling the waters with warships and everything. Talks on sharing the resource, which was estimated on the show to be one of the largest oil fields in the world, have broken down. Japan can't actually stop China from taking the oil, so all they do is sit and fume.

Why should that surprise you? The US has bombed and invaded countries
due to non existent weapons of mass destruction. Reality has absolutely
no bearing on their actions. They're much like you in that respect.

Before I forget..Butch says thanks for the flowers and the gift

Yes. Here is an interesting physics experiment with explanation.
<http://www.allaboutcircuits.com/vol_1/chpt_14/6.html>

> If we short one winding out and measure the other winding's inductance
> then we will have a measure of the coupling between the two coils.

The problem with this is if you short either coil the other will also be
shorted. The transformer through the mutual inductance coupling between
them effects an impedance transfer dependent on the turns ratio. You
short one coil and guess what? The 0 ohm short is coupled to the other
coil. If you have the equipment you can measure the self inductance of
one coil and watch that value drop when you short the ends of the other
coil together. Better coupling will result in a bigger change in
inductance.

> The lower the inductance measured then the lower the stray inductance
> - or supposedly the better the coupling. With fewer turns then I
> think maybe the lower the stray leakage we will measure.
>
> Am I on the right track?

The idea here is high mutual inductance or coupling between the coils
and have the self inductance of each coil approximate the impedance of
the wire on one coil and the value of coax on the other.

Also you want the path through the windings to be an electrically short
path so the UNUN will work on the high frequency end.

> I think the balun design can use the very small cores as long as we

> get home.
>
> Not so many good places to find info on receive baluns on www.

There is stuff around on the net but a good book is better bet.

BALUN and UNUN design can get a little complicated when you want broad bandwidth. If you have a book with a proven design worked out for an antenna that is a great way to hack a BALUN or UNUN.

The thread started out with you grabbing what was on hand and just following a few rules will get an UNUN working pretty close to optimal with just the stuff on hand on at least part of the SW spectrum.

With the unknown core on hand the hack would be the minimum or nearly minimum number of turns in both primary and secondary windings to get the impedance ratio you need to get.

The winding technique changes the performance character of the transformer.

If you wind primary and secondary apart from each other you will cause all or nearly all the flux linkage to go through the core. The consequence of this is the cores have an efficient frequency range and chances are it will not work so well through the entire SW band range of 3 to 30 MHz.

If you wind them together then the two coils couple to each other directly in addition to the common flux linkage generated in the core. If the core response is good on the low end and drops off on the high end the close coil to coil coupling will help on the high end as an example.

I bought most of my radios from Universal. Whether you want to buy from
them or not here is a link comparing the features of 17 models Grundig,
Sangean, Sony and Kaito.

<http://www.universal-radio.com/catalog/portable/chartp.html>

With that link you can find all the portables that have the features you
want. Then look up your choices for reviews on the web.

I would have been the KVTA imaging voice, not a host. But when I was
on the air, over the years, I was very cleverly known as David Peter Maus.

PI's, or Per Inquiry spots, are sold and operated differently than
traditional spot advertising, but even PI's are tracked with regional or
local toll free numbers, logged IP's at websites and zipcodes on credit
card numbers. Even if they ask you where you heard the spot, if the
location data and your claim don't agree, often the data may be tossed
out depending on who's actually handling the PI. And toll free numbers
are usually set up so as to only receive calls from specified exchanges,
or specified areas. Out of region calls do not connect.

So, yeah, even then, credit is local. What happens on WWCR, the way advertising is sold , is different than the way advertising is sold on the broadcast bands. WWCR would be selling PI's and the station would receive a commission on every contact made to the advertiser's telephone number. Or the numbers in a spot buy would be estimated, like the early days of cable tv. There the sales were based on estimated households connected to cable that may be accessible to the program/channel/timeslot purchased. But actual viewership could be zero. WWCR would be selling the total population within their coverage area, and that figure broken down by demographics, or potential listenership figures estimated by what may actually be an arbitrary yardstick. Since no one knows how many are actually listening, such estimates are based on assumptions that have not been relevant for decades. It's not impossible for AMBCB to sell this way. But in today's over researched markets, no agency would make such a purchase. And no station would attempt to sell it, because no factual ratings information would be available. In that case, the only reasonable choice would be a PI. Many stations don't accept PI's anymore. Mostly because of the snake oil salesmen who sell them, and the fact that they tend to produce marginal results at best. Mostly, they're a waste of time.

> independent market share survey method.
>

Phone out research is a common practice. It's not cheap, but many stations do it. What they don't do is make long distance calls to do it. It's expensive, and the return is statistacally zero. Ratings companies like Arbitron and Nielsen measure listening habits by station, time of day, time spent listening, and break the numbers down by demographics, with hour by hour breakouts. If the sample is accurate, the numbers tell quite a story. And sales then sells advertising based on the rating, share, TSL, and what the market will bear. When Karmazin was at CBS, he wanted to see a conversion rate of 200%, that is, sales producing revenue share of twice ratings share. The station I was at, we often went higher than that. Agencies want to buy cost per point. A dollar figure for each share point in target.

Where the diaries go is determined by zipcode, ethnic distribution, economic status, hat size and price of recycled lawn furniture within the Area of Dominant Influence.

ADI is deterimined by geographic size of the potential market, population distribution, and signal strength of the station in question.

Now there are multiple factors that are involved in each of these considerations...I'm only hitting highlights here.

So advertising is targeted by desired demographic, within the Area of Dominant Influence and which stations deliver the desired bodies at the best cost. When advertising is sold like this, and bought on a cost per point basis, there is no value to the station or the advertiser to the DX signal. If it stops at the end of fringe coverage, they could care less.

Which gets us back to the whole issue of this thread: IBOC and it's effect on what is left of the DXing hobby.

No one cares. DXers are not statistically relevant to the business of broadcasting. They produce no revenue. They amount to no demographic group. They cannot be pushed, filed, stamped, indexed, briefed, de-briefed or numbered.

They're like Dr Pepper drinkers...they defy marketing science.

So that IBOC creates interference to DXing is of no consequence to anyone who has a financial interest in a broadcast station. And, like it or not....and make no mistake, I do NOT like it, and am NOT a fan of IBOC or where Broadcasting as an industry has gone in the last 15 years, but it is what it is.....Radio in the United States is always, and has always been, about money. Even NPR and CPB. It's always about the money.

So, to get back to my original point...if you're going to fight IBOC, it must be done on the grounds of LOCAL interference. Because LOCAL interference affects LOCAL revenue. And it's always about the money. Always.

p

I wonder if magnet wire is a good idea? Generally magnet wire is
designed to get the turns as close as possible. I'm not sure that is
best for high frequency use since you want to minimize stray
capacitance.

Ditto!

I heard it this morning again. It is as someone said earlier "KJES"
out of Nuovo Messico.

That's sounds like a church where you might find people who look like
the guy with the wire glasses and pitchfork, standing next to his
stern looking wife.

What is an imaging voice? Would you be the guy saying "this is KVTA
1520, its 12 o'clock" on the hour? Maybe reading some of the commercials?
Radio station self promotion ads?

Thanks again for explaining the marketing situation for AMBCB. Very
instructive.

So if anyone wants to complain about IBOC it has to be one local station interfering with another local station.

If you will indulge me I have another question about the definition of local. Lets take an example from this web site if you have no objections to it as an example. Here is a coverage map for KFI 640 AM. You will note it has three contours local, distant and fringe.

<http://radio-locator.com/cgi-bin/pat?call=KFI&service=AM&status=L&hours=U>

For the purposes of marketing which one applies local, distant or fringe?

If someone wanted to complain about IBOC interference which contour would the two stations have to be within for the complaint to be considered a valid complaint?

Or maybe this contour map is not appropriate for either question?

> U>
>
> For the purposes of marketing which one applies local, distant or fringe?

In my experience the local market would be out as far as the fringe contour for ratings considerations. But that's not the same as as the area where practical sales can be made. And often it's not the whole market. At a station I worked in Chicago we had reach all the way to Bloomington, but sold to primarily the collar counties and there, in specific zipcodes. Where research, ratings and other factors indicated we had high concentrations of listeners. We sold very little in the city. And we sold nothing beyond the suburbs. We were on national and regional buys, but local sales were in those zipcodes where we had concentrations of listeners.

Not being familiar with the market, I couldn't say where listener concentrations would determine local sales targets for KFI. David could help you with that.

>
> If someone wanted to complain about IBOC interference which contour
> would the two stations have to be within for the complaint to be
> considered a valid complaint?
>
> Or maybe this contour map is not appropriate for either question?

I'd have to check my FCC references for the specifics on signal contours, and interference. Again, David may be more readily versed in that. However, there are cases where significant listening occurs outside of the major signal contours. If this is rated listening, there maybe valid claims made there. There are several factors. One of which is the question of available alternatives. If there are available alternatives to a listening population beyond the city grade contour, some complaints may not matter. Then again, if there are no alternatives and a station is a primary source of information, complaints about interferenced are taken quite seriously. But there has to be a good deal of documentation and the complaint is best filed by a station engineer. If you can demonstrate that any signal is preventing you from listening

to a station in an area of concentrated listening, rated listening, the station itself will file the complaint and move heaven and earth to get something done. That said, IBOC has the blessing of the Commission. In fact, Michael Powell himself said that if there were any new modulation systems to be implemented, AM or FM they would be digital. Only digital. Meeting this criterion and having already been granted approval may make complaints more difficult to be heard. But if you don't make the complaint, you'll not get any results either way.

Telamon,

Many of the WWW webpages related to the RF Matching
Transformers used for Receive "Only" Shortwave Listener (SWL)
Longwire {Random Wire} Antennas for Broadband 3 MHz (500 kHz)
to 30 MHz use specify 9:1 (10:1) Matching Transformers.
[With the Number of Windings 3 into 1]
http://www.alg.demon.co.uk/radio/136/ant_xformer.htm
http://members.tripod.com/michaelgellis/imptrans.html
http://users.netonecom.net/~swordman/Radio/unun.htm
http://www.kc7nod.20m.com/new_page_1.htm
http://ww2.netnitco.net/users/wt9w/Toroids.html
http://www.qsl.net/wa1ion/bev/bb_antenna_matching.pdf
http://www.naswa.net/badx/antennas/SWL_longwire.html
http://www.dxing.info/equipment/impedance_matching_bryant.pdf
http://www.dxing.info/equipment/impedance_transformer_bryant2.doc

http://www.hard-core-dx.com/nordicdx/antenna/feed/balun3.html
http://www.hard-core-dx.com/nordicdx/antenna/feed/magbal1.html

IIRC - Most of these webpages suggest building your own
RF Matching Transformers with the Antenna Side Winding
make-up of Many Turns (~30) -vice- fewer turns (<10).

Standard One-Hole Toroid (Donut)
http://www.universal-radio.com/catalog/misc/amidon.html
#1542 FT 50-43 Ferrite Toroidal Core
- - - Qty = 3 @ 0.500 OD x 0.281 ID x 0.188H
#1544 FT 82-43 Ferrite Toroidal Core
- - - Qty = 3 @ 0.825" OD x 0.520" ID x 0.250" H
#3494 FT114-43 Ferrite Toroidal Core
- - - Qty = 1 @ 1.142" OD x 0.750" ID x 0.295" H

* Primary {Coax Cable Side} Windings : 8 - 9 - 10 - 11
* Secondary {Antenna Side} Windings : 24 - 27 - 30 - 33
- - - Vice fewer windings - - -
* Primary {Coax Cable Side} Windings : 1 - 2 - 3 - 4
* Secondary {Antenna Side} Windings : 3- 6 - 9 - 12
Note - Using average size Magnet Wire : AWG 24~30

Binocular Two-Hole Ferrite Core
http://www.universal-radio.com/catalog/misc/amidon.html
#0471 BN-43-202 Two Hole Core
- - - Qty = 4 @ 0.525" OD x 0.150" ID x 0.550" H x 0.295" T

* Primary {Coax Cable Side} Windings : 3 - 4 - 5 - 6
* Secondary {Antenna Side} Windings : 9 - 12 - 15 - 18
Note - Using 'very thin' Magnet Wire : AWG 30~36

RadioShack "Magnet Wire"
RadioShack Catalog # 278-1345

< Snip >

There is no advantage in making the electrical length longer then
necessary. Where you do this the high frequency performance will suffer
where the low frequency performance is still OK. Maybe some of the web
pages are considering AMBCB and SW low band long wire matching. More
turns would be OK for low band operation. 10:30 turns can be a long path
through the transformer depending on core size.

Hello

Whatever you want to buy , first try to listen to the the radio you
want to buy alongside the one you know.
Every radio i bought I first tried it out for several hours.
Is it logical to handle ?
do you like the sound ?
and so on. The looks you can get used to but the sound en feel is more
difficult to get used to.

I hope this helps a bit

Yup...my typo. Although it was a nightmare topic too, but a well done documentary. Far better than the 2005 Documentary Feature winner Penguins which was nothing more than the screen equivalent of muzak.

On the subject of Oscars, I'm still amazed that Crash took best picture, mostly because it was so disjointed. I would have selected The Constant Gardener.

I agree with Bob about the editing (or lack thereof). I'm just coming back to ham radio after a long absence, and was looking forward to a high qualitiy technical publication when I subscribed to QEX. I'm basing my review on only two issues, but so far I'm not at all impressed. For a bi-monthly publication a very low article count. Many of the articles are rambling and unfocused. Very poor standardization and consistency of graphics. Think I read that they just got a new editor, so perhaps things will improve - lets hope so!

I'm a year behind the curve on films as I wait until they hit the HBO
tier of distribution. Movie theaters in the suburbs are not worth the
ticket.

I do buy music videos as soon as they are released.

[snip]

As far as I know, the advertising heard on WWCR is bought by the people who buy airtime from WWCR. I do know WWCR actively solicits programming but I've never heard WWCR solicit advertising as I've heard on a few local stations.

http://www.wwcr.com/wwcr_sales_information.html

Alex Jones has said the money he gets from Berkey is what he uses to stay on shortwave.

I have found that antenna tuners provide tactile entertainment for the
bored SWL, but little more. They are a couple more knobs to twist.

If one is a true RF professional the idea of putting a Hi Z generator
into a Low Z load is too much. The 9:1 autotransormer also puts every
part of the antenna at DC ground, thus protecting the radio's input.
Plus, it's a very elegant way to connect the wire to the shielded
cable.

I don't know about your area, but the large multi-screen theaters are
way down in attendance. There have been three smaller theaters open
that focus more on independent movies and those are fairly well
attended. And you know, I just enjoy going out to the movies,
especially if they are serving fresh popcorn. The experience of seeing
and hearing a movie on a theater screen cannot be duplicated in a home
theater.

The Landmark chain is more or less nationwide and has shown some
excellent movies. A german movie that I found particularly riveting
was The Bunker.

We have a quite a few poles that, when the insulators become filthy, allow arcing to occur. The crackling is often audible to the human ear, and a mess on the RF. This can be very noisy. A simple cleaning of the insulators can help this matter considerably.

Other than that, it's usually either a malfunctioning light ballast or some transformer/switchbox on the pole.

Still, you have that wonderfully sensitive receiver, and your balun
hasn't changed the signal to noise ratio; it's only made everthing
louder. Same argument he's using against antenna tuners :-)

1179. Why antennas aren't necessary for shortwave listening.

Newsgroup: rec.radio.shortwave
Date: 2006-03-08 18:03:33 UTC

A couple of years ago I bought a Racal RA17 receiver. I used it for a few months and now it patiently waits for me to go thru it more completely. I think it has a noisy circuit in it now.

I recall listening in on some 75m guys when I realized I hadn't connected up the antenna. Granted many in the 75m crowd are probably running CB type power levels, but on the other hand my shack is down in the basement. I tuned around the bands and was surprised what the radio would do sans antenna.

I'm not sure what kind of a front end the Racal has in it but it certainly is a sensitive beast. I hope to one day get it out of the inbasket and back into the shack. I would like to put it next to another SP600. I had to sell my SP600 in order to get the Drake R8B. The R8B is of course my favorite.

So there ya go. Now if somebody knows what the Racal has for front end please tell.

It does help signal:noise. It keeps the antenna away from the house.

The Racal is an excellent receiver.

Probably just has a bad thermionic device.

The receiver is deceptively quiet but it is indeed sensitive. Works
well on SSB with the BFO, if you back off the IF gain a tad.

1185. Re: Opinions on Eton E5/Sangean ATS-505 or PT80

Newsgroup: rec.radio.shortwave

Source record: 66576

i have the sangean ats-505. its a good radio. the tuning is odd because it doesnt use a decimal for direct entry of frequencies. the software knows where the decimal is according to the band selected. there is no ssb available on mw even if ssb switch is selected, again the software knows what band is up and disallows the ssb function. it could use a narrow filter but it doesnt provide that. for casual listening this radio is adequate. i got mine for $50 on close-out at rat shack. if i had paid the full asking price then i probably would be more critical. doesnt the sony 7600g come for only a little more than the asking price of the 505? the 505 is a nice radio but if you are very critical or looking for a SERIOUS radio then you could get a better one.

Nice on-topic post. A tuner isn't really necessary for impedance matching,
but it can act as a pre-selector if your receiver has a poor front end in it.
Which can help improve things in some situations.

I like to listen to utility stations most of the time. I hear better with my ham rig & outdoor antennas than I do with my Panasonic Rf-2200 or DX-398 and their telescoping antennas.

This indicates a problem with the radio. My best guess is that the
signals are coming in the power mains and coupling to the antenna
input. You will not be able to control what you hear with the antenna
connected to the radio.

You could try some power line filtering to see if the signals go away
with no antenna connected. If you don't solve this then obviously you
will be hearing a lot of power line noise on the radio.

Another thing to try would be a 50 ohm resistor with short or shielded
leads. With the resistor across the antenna input the radio should be
quiet.

Not sure where you are in the LA megalopolis but Landmark has several theaters in the area. 20 miles from Canoga Park is quite a radius. These are not so much restored classical style theaters as they are smaller theaters running usually very interesting foreign and domestic films. Check this link:

http://www.landmarktheatres.com/Market/LosAngeles/LosAngeles_Frameset.htm

I recently picked up a used Sony 2010 and was astounded that it would
pick up the nightly 3922 net with just the built-in 47" whip antenna,
even the 100 watt guys 500 miles out.

> but it can act as a pre-selector if your receiver has a poor front end in it.
> Which can help improve things in some situations.

People like to argue about tuners and pre-selectors so I would like to expand on this a little.

A pre-selector is basically a band pass filter. Main use is to attenuate out of band signals that may, depending on how good your radios blocking is, be very helpful in reducing false images from showing up and making reception of in band signals messy and confusing. Some units are adjustable to the point that even some in band signals can be attenuated. This fine-tuning is good from the standpoint that radio has a narrower range of signals to block and this should result in improved signal to noise as any time you limit the bandwidth of a spectrum the noise floor drops. Noise is broadband energy and any time you limit the received bandwidth you reduce the noise power. Obviously the better the receiver is designed the less there is to be gained by using a pre-selector.

An antenna tuner is a circuit used to resonate an antenna at the frequency of operation. The effect on reception appears similar but occurs for a different reason. Because the action of the tuner causes the antenna to be optimized for the frequency of operation, the range of frequencies above and below it are relatively attenuated due to not being picked up as efficiently so you get a similar result but for a different reason.

Why is the distinction important? Because the pre-selector can go anywhere in the transmission line (coax) from antenna to radio and is most often conveniently located near the radio. The tuner needs to be a part of the antenna and so is located there where its output is at the coax transmission line to the radio.

The pre-selector is an in line band-pass filter that can go anywhere along the transmission line. The antenna tuner is located at and is actually a part of the antenna.

What's is that? You say hams use antenna tuners in the shack for transmitting purposes. This is not a good practice but if they are using

an antenna that is close to resonance and are just trying to protect the transmitter from dealing with the additional reflected power then its OK but in using it they are not improving how well their antenna functions. The tuner in the shack does not improve or change how well their antenna radiates.

Another thing people keep endless repeating is that nether antenna tuners or pre-selectors help and just make signals louder (they mean stronger), which of course with the AGC operation of the radio means the result of using either is the S meter reads higher. This is only true for medium to strong signals. For a weak signal, the signal to noise should at least have a small improvement, determined by how weak the signal was to begin with, receiver design, local noise, and current propagation. If the signal is very weak, the tuner and pre-selector could result in it being readable. Here the antenna tuner has the best possibility of making a signal that is below the receiver noise floor strong enough to be heard (detected) on the radio.

In summery, in my opinion, a pre-selector would be a good bet to improve portable reception when connected to an external antenna especially the worse case single conversion units. Following that in usefulness would be an antenna tuner. People chasing DX with tabletop units might want to try antenna tuners where less useful for them would be pre-selector use.

People do not seem to understand the purpose of Usenet, which is to post
news. Naturally, any on topic information pertaining to the news group
charter is also OK to post.

Most people including myself also include editorial content along with
the news and information as such often needs context to be most useful.
Some people then go off the reservation with total or nearly total
editorial content (opinion) for which Blogs were created. The people
that think this is a Blog space belong in the kill file along with the
off topic abusers.

It doesn't take a rocket scientist or electrical engineer to understand the over all quality of reception for analog receivers will get worse with increasing use of digital transmission modes. Concurrent analog and digital transmissions are compatible but can only make analog reception worse. Anybody telling you different is lying to you.

It is stupid to implement digital transmission in a way that degrades current analog reception. Part of the AMBCB band should be allocated to digital or the band expanded for digital transmissions. Same for the awful noise generated by DRM on the short wave bands.

Made my first crystal radio back in Intermediate School. I was into astronomy at the time (knew more than the teacher <G>). So during tests and such, he had me winding coils and bread boarding my radio while listening to SW. He was a Ham and got me started in radio.

In my freshman year, had another Ham as a teacher. We would sit around after school and listen on various radios, including Xtal sets. In electronics class (different teacher), we started out building Xtal sets, and advanced to 5 tube superhets. Got my first SW set from my Father's friend. Old Packard-Bell. Tuned 5.5-18 Mcs. First station heard was Radio Australia, I was HOOKED.

Keep thinking I should build another Xtal set.....

Somewhere I have the *cans* (with a quarter inch plug) to use with it.....Just can't seem to find *fahnstock (sp?)* clips anywhere. Somewhere, have a tuning cap, and several *oatmeal* containers...

One of these days.....

Eric

I hate to say this, since it will classify me as an
old timer, but the people using the net would
do well to have a sense of history about items
such as usenet, gopher and the www. I'm not
talking about taking classes, per se, but
understanding the difference between a blog,
an online column, usenet and website forums
```

would be useful.

I don't see how that's possible. The only ideology I'm aligned with
is Fundamental Constitutional Revolutionary thinking as espoused by
the Founders.

You have a lot of pride invested in the current regime and have
limited objectivity. Nobody likes to admit they've been hoodwinked.

A receiver pre-amp can get the signal (and noise) above the AGC
threshold so at least the volume will be constant. A pre-amp between
the antenna and the transmission line can keep the cable from
attenuating the signal too much. However, at HF frequencies, line
losses are for the most part inconsequential.

Rickets, you wouldn't know a revolution if it crawled up your mentally ill, drug addled ass and decided to spend the winter.

In other words, you're a delusional, jaw flapping 'tard boy, who'd run to mommy the first time the 'revolution' came anywhere near you, because chances are, you'd be one of the first casualties (i.e. you're a useful idiot).

Good assumption.

I'm not big on pre-amps because they add their own noise to the existing
signal to noise but they can help. For an amp the be a help it must be
low noise and the best location would be at the antenna. Amps are best
used where you have a long run of coax. Other feature enhancements of
the amp design can come into play to make them more valuable.

Dick Lamm was a longtime Democratic Governor of Colorado. His application of some of Arnold Toynbee's historical themes about the fall of past empires to today's U.S. is interesting and pertinent.

We know Dick Lamm as the former Governor of Colorado. In that context his thoughts are particularly poignant. Last week there was an immigration over-population conference in Washington DC, filled to capacity by many of American's finest minds and leaders.

A brilliant college professor by the name of Victor Davis Hanson talked about his latest book, "Mexifornia," explaining how immigration, both legal and illegal, was destroying the entire state of California. He said it would march across the country until it destroyed all vestiges of The American Dream.

Moments later, former Colorado Governor Richard D. Lamm stood up and gave a stunning speech on how to destroy America. The audience sat spellbound as he described eight methods for the destruction of the United States. He said, "If you believe that America is too smug, too self-satisfied, too rich, then let's destroy America. It is not that hard to do. No nation in history has survived the ravages of time. Arnold Toynbee observed that all great civilizations rise and fall and that 'An autopsy of history would show that all great nations commit suicide."

" Here is how they do it," Lamm said, "First, to destroy America, turn America into a bilingual or multi-lingual and bicultural country." History shows that no nation can survive the tension, conflict, and antagonism of two or more competing languages and cultures. It is a blessing for an individual to be bilingual; however, it is a curse for a society to be bilingual. The historical scholar, Seymour Lipset, put it this way: "The histories of bilingual and bi-cultural societies that do not assimilate, are histories of turmoil, tension, and tragedy. " Canada, Belgium, Malaysia, and Lebanon all face crises of national existence in which

minorities
press for autonomy, if not independence. Pakistan and Cyprus have divided. Nigeria suppressed an ethnic rebellion. France faces difficulties with Basques,
Bretons, and Corsicans."

Lamm went on: "Second, to destroy America, invent 'multiculturalism' and encourage immigrants to maintain their culture. I would make it an article of
belief that all cultures are equal. That there are no cultural differences. I would make it an article of faith that the Black and Hispanic dropout rates
are due solely to prejudice and discrimination by the majority. Every other explanation is out of bounds."

Third, "We could make the United States a 'Hispanic Quebec' without much effort. The key is to celebrate diversity rather than unity. As Benjamin Schwarz
said in the Atlantic Monthly recently: "The apparent success of our own multiethnic and multi-cultural experiment might have been achieved not by tolerance but by hegemony. Without the dominance that once dictated ethnocentricity and what it meant to be an American, we are left with only tolerance and pluralism to hold us together. " Lamm said, "I would encourage all immigrants to keep their own language and culture. I would replace the melting pot metaphor with the salad bowl metaphor. It is important to ensure that we have various cultural subgroups living in America enforcing their differences rather than as Americans, emphasizing their similarities."

"Fourth, I would make our fastest growing demographic group the least educated. I would add a second underclass, unassimilated, undereducated, and antagonistic to our population. I would have this second underclass have a 50% dropout rate from high school"

"My fifth point for destroying America would be to get big foundations and business to give these efforts lots of money. I would invest in ethnic identity,
and I would establish the cult of 'Victimology.' I would get all minorities to
think that their lack of success was the fault of the majority I would start a
grievance industry blaming all minority failure on the majority population."

"My sixth plan for America's downfall would include dual citizenship, and promote divided loyalties. I would celebrate diversity over unity. I would stress differences rather than similarities. Diverse people worldwide are mostly engaged in hating each other - that is, when they are not killing each
other. A diverse, peaceful, or stable society is against most historical precedent. People undervalue the unity it takes to keep a nation together. Look at the ancient Greeks. The Greeks believed that they belonged to the same race; they possessed a common language and literature; and they

worshiped the same gods. All Greece took part in the Olympic games.
A common enemy, Persia, threatened their liberty. Yet all these bonds were
not strong enough to overcome two factors: local patriotism and geographical
conditions that nurtured political divisions.
Greece fell. "E Pluribus Unum" -- From many, one. In that historical
reality, if
we put the emphasis on the 'pluribus', instead of the 'Unum,' we will
balkanize America as surely as Kosovo."

"Next to last, I would place all subjects off limits; make it taboo to talk
about anything against the cult of 'diversity.' I would find a word similar
to
'heretic' in the 16th century - that stopped discussion and paralyzed
thinking.
Words like 'racist' or 'xenophobe' halt discussion and debate. Having made
America a bilingual/bicultural country, having established multi-culturism,
having the large foundations fund the doctrine of 'Victimology,' I would
next make it impossible to enforce our immigration laws. I would develop a
mantra:
That because immigration has been good for America, it must always be good.
I would make every individual immigrant symmetric and ignore the cumulative
impact of millions of them."

In the last minute of his speech, Governor Lamm wiped his brow. Profound
silence followed. Finally he said, "Lastly, I would censor Victor Davis
Hanson's
book 'Mexifornia'. His book is dangerous. It exposes the plan to destroy
America. If you feel America deserves to be destroyed, don't read that
book."

There was no applause. A chilling fear quietly rose like an ominous cloud
above every attendee at the conference. Every American in that room knew
that everything Lamm enumerated was proceeding methodically, quietly,
darkly yet pervasively across the United States today. Discussion is being
suppressed. Over 100 languages are ripping the foundation of our educational
system and national cohesiveness. Barbaric cultures, such as those that
practice
female genital mutilation, are growing as we celebrate 'diversity.' American
jobs
are vanishing into the Third World as corporations create a Third World in
America - take note of California and other states - to date, ten million
illegal
aliens and growing fast. It is reminiscent of George Orwell's book 1984." In
that
story, three slogans are engraved in the Ministry of Truth building:

"War is peace,"
"Freedom is slavery," and "Ignorance is strength."

Governor Lamm walked back to his seat. It dawned on everyone at the
conference
that our nation and the future of this great democracy is deeply in trouble

and
worsening fast. If we don't get this immigration monster stopped within
three
years, it will rage like a California wildfire and destroy everything in its
path, especially The American Dream .

Iranian mullahs still getting nuclear help from Communist China

Gulf Resources Development Corporation, a firm owned by the Iranian regime and based in Dubai, United Arab Emirates, "has smuggled sizeable quantities of a type of graphite known as ceramic matrix composite, or CMC, from China to Iran".

http://www.worldnetdaily.com/news/article.asp?ARTICLE_ID=49156

CMC is a chemical required to insulate weaponized uranium in a bomb. It is just the latest example of the Communist regime's aid to the mullah's nuclear weapons program.

Attacks on Arab-American Psychologist Wafa Sultan

Islamist Sheikh on Al-Jazeera Calls Her Heretic; Syrian Sermon Calls Her Infidel

On February 21, 2006, MEMRITV released a clip featuring an interview with Arab-American psychologist Wafa Sultan on Al-Jazeera TV. During the interview, Dr.Ibrahim Al-Khouli accused Sultan of being a "heretic" for attacking current aspects of Islamic society.

THE CLIP HAS NOW BEEN VIEWED OVER ONE MILLION TIMES ON MEMRITV.ORG.
http://www.memritv.org/search.asp?ACT=S9&P1=1050
(Link to transcripts below)

Following the release of this clip, Bassam Darwish, editor of the reformist website www.annaqed.com, posted a February 28, 2006 report by AFP stating that a Friday sermon in Damascus had harshly criticized her appearance on Al-Jazeera: "[Syrian human rights activist Anwar] Al-Bouni reports that one of the sheikhs described Wafa Sultan as 'an infidel,' accusing her of 'harming Islam more than it was harmed by the cartoons of the Prophet Muhammad, recently published in European newspapers.'

"According to Al-Bouni, 'the Syrian authorities began to use the weapon of the official religion as a new tool to oppress society... It is no longer enough for them to arrest activists, to terrorize them, and to prevent them from traveling, but now they recruit against them the pulpits of takfir [accusing other Muslims of heresy] and takhwin [accusing Muslims of treason].' He described this policy as dangerous and destructive."

The following are excerpts from an interview with Wafa Sultan that aired on Al-Jazeera TV on February 21, 2006. It is followed by excerpts from a debate in which she participated, in a talk show that aired on Al-Jazeera TV on July 26, 2005.

I have been hearing a numbers station on 13.691 MHz LSB. Does anyone know which station this is?

It appears each day at 0000 UTC (7:00 PM EST) on the top of the hour.

Thank-you....

Carlos

www.google.com CD V-726DX Prototype (1960-1962)

I wonder how long it will be and we start seeing those kinds of radios again.You know,,,, with the CD markings on them.
I own a bunch of old tansistor and tube type radios that have the CD marknгs on them.

This sounds like an urban legend. There are few specifics about anything except the main message. In fact, this sounds like the "main points of Communism" urban legend that circulated among far right conservatives in the 60s and later, alleging that there was a ten point plan by the Communists to destroy capitalism that was found during WW1 by American troops. In fact, it seems to me that many of the main points of the ten points of Communism UL have made it into this story. Furthermore, this sounds suspiciously like a blatant attempt to promote the book "Mexifornia" by referring to it as dangerous and implying that it is forbidden fruit. Who is Victor Davis Hanson, and what is his agenda? Is he spreading a UL in order to get people to read his book?

Been hearing conversation between two men in Spanish for the last five minutes...some interference, but there's a thunderstorm here in Wisconsin. Seems to be a political discussion, as I heard "politico" a few times and mention of Guantanamo. Now hearing a woman talking at 2:40 UTC.

Any ideas?

No, the IBOC stuff sounds like
sssssssssssssshhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhhh. This occurs on
the channel directly above and directly below the culprit broadcaster. If
you are close to the station, the interference takes up another half channel
in each direction. What a mess! I hope those stations go out of business,
but of course, that is only wishful thinking.

Anybody remember AM Stereo? Point made. I doubt that IBOC will get
anywhere unless the feds legislate it like they did with HDTV.

March 1985: US Escalates War in Afghanistan

Osama bin Laden in 1989.
The CIA, British MI6 (Britain's intelligence agency), and the Pakistani ISI agree to launch guerrilla attacks from Afghanistan into then Soviet-controlled Tajikistan and Uzbekistan, attacking military installations, factories, and storage depots within Soviet territory, and do so until the end of the war. The CIA also begins supporting the ISI in recruiting radical Muslims from around the world to come to Pakistan and fight with the Afghan mujahedeen. The CIA gives subversive literature and Korans to the ISI, who carry them into the Soviet Union. Eventually, around 35,000 Muslim radicals from 43 Islamic countries will fight with the Afghan mujahedeen. Tens of thousands more will study in the hundreds of new madrassas funded by the ISI and CIA in Pakistan. Their main logistical base is in the Pakistani city of Peshawar. [The Hindu, 9/27/01; Washington Post, 7/19/92; Pittsburgh Post-Gazette, 9/23/01; Honolulu Star-Bulletin, 9/23/01] In the late 1980s, Pakistani President Benazir Bhutto, feeling the mujahedeen network has grown too strong, tells President George H. W. Bush, ï¿½You are creating a Frankenstein.ï¿½ However, the warning goes unheeded. [Newsweek, 9/24/01] By 1993, President Bhutto tells Egyptian President Hasni Mubarak that Peshawar is under de facto control of the mujahedeen, and unsuccessfully asks for military help in reasserting Pakistani control over the city. Thousands of mujahedeen fighters return to their home countries after the war is over and engage in multiple acts of violence. One Western diplomat notes these thousands would never have been trained or united without US help, and says, ï¿½The consequences for all of us are astronomical.ï¿½ [Atlantic Monthly, 5/96]

People and organizations involved: Benazir Bhutto, Central Intelligence Agency, UK Secret Intelligence Service

1986: Bin Laden Works with CIA, at Least Indirectly

The CIA, ISI, and bin Laden build the Khost tunnel complex in Afghanistan. This will be a major target of bombing and fighting when the US attacks the Taliban in 2001. [Honolulu Star-Bulletin, 9/23/01; Pittsburgh Post-Gazette, 9/23/01; The Hindu, 9/27/01] It will be reported in June 2001 that ï¿½bin Laden worked closely with Saudi, Pakistani, and US intelligence services to recruit mujahedeen from many Muslim countries,ï¿½ but this information has not been reported much since 9/11. [UPI, 6/14/01] A CIA spokesperson will later claim, ï¿½For the record, you should know that the CIA never employed, paid, or maintained any relationship whatsoever with bin Laden.ï¿½ [Ananova,

10/31/01]

People and organizations involved: Taliban, Central Intelligence Agency, Pakistan Directorate for Inter-Services Intelligence, Osama bin Laden

I bought a small Lenoxx Sound AM/FM Sports Radio,model PR-37 radio at
the Goodwill store this afternoon.Instead of the usual dial
markings,this radio is marked like this,
AM . . . . .53 . . 65 . . 90 . 120 . . 170 . . X10KHz
FM . . . . . 88 . . 94 . 100 . . 106 . 108 . . . . . MHz

Why those kind of markings? Foreign market radio?

http://www.w4uvh.net/dxlatest.txt
** KUWAIT [and non]. I recently noted bubble jamming marring RCI English to South America at 2200 on 11990, and wondered what could be the real target? Same bubble jamming on 11990, March 8 at 1531 past 1600 messing up a station in Arabic, which proved to be R. Kuwait. Had a wide variety of music, including a bit of Bach`s Toccata & Fugue in d minor at 1532. Kept talking right thru hourtop, finally ID at 1601. This service is aimed toward Europe and NAm, and would otherwise enjoy good reception, tho it degraded after 1600. It`s hard to imagine why anyone would bother to jam this either, unless it`s programming just too secular for some tastes (Glenn Hauser, OK, WORLD OF RADIO 1307, DX LISTENING DIGEST)

>It does help signal:noise. It keeps the antenna away from the house.

Not from the 9:1 transformation though. Only due to the grounding ,
and decoupling of the feedline. The 9:1 balun is not required to
fulfill
that job. Bob is right. It's fairly rare to actually improve the s/n
ratio
just from the transformer on a wire of any decent length.. You already
have more signal than you need without a transformer, unless the
radio is half dead, or the antenna wire is very short. The improvement
in local noise is due to decoupling of the feedline, not the match.
And yes, a tuner can tighten up the front ends of many radios.
Not needed for actual signal level, but they can reduce out of band
crud. IE: my IC-706 receives some MW-BC crud on 160m. But if
I put my tuner inline, it kills it. I have different tuners, but my
main
tuner is a mfj 989c I picked up for nothing. But normally, I use no
tuner. I use it for the wattmeter only 98% of the time. All my
antennas
are resonant on the bands they are designed for, and don't need a
tuner on any other bands I might tune. I've got buckoo signal..I could
lose 3/4 of what I have and still probably not reduce my s/n ratio on
most
all HF bands.

A couple of questions.
Did you make this up or is there a recognized news outlet that
reprinted this lecture.
Do you remember if he removed his pointed white cap and mask before or
after the lecture.
Was this given in front of the national KKK Convention or the John
Birch Society Annual Meeting.
Did he offer any references to support the many baseless statements
like this: History shows that no nation can survive the tension,
conflict, and antagonism of two or more competing languages and
cultures.

I havent had much luck on amateur radio forums so ill ask the question here, Im looking for
a receiver with good sensitivity on 800 - 1000mhz or there abouts, im using a Icom 706 that
covers 500mhx down to 100khz & need something to fill the gap, right now im using a pro
2006 scanner but i would like something with manual control of frequencys.

You make the mistake they want you to make. You think that what
happened in 1989 has no relationship to what happens today. Your
sense of history has been methodically trashed. So be it.

Let's start in July, 2001...

''CBS News reports that Attorney General Ashcroft has stopped flying
commercial airlines due to a threat assessment, but ï¿½neither the FBI
nor the Justice Department ... would identify [to CBS] what the threat
was, when it was detected or who made it.ï¿½ [CBS News, 7/26/01]
ï¿½Ashcroft demonstrated an amazing lack of curiosity when asked if he
knew anything about the threat. ï¿½Frankly, I don't,ï¿½ he told
reporters.ï¿½ [San Francisco Chronicle, 6/3/02] It is later reported
that he stopped flying in July based on threat assessments made on May
8 and June 19. In May 2002, it is claimed the threat assessment had
nothing to do with al-Qaeda, but Ashcroft walked out of his office
rather than answer questions about it. [Associated Press, 5/16/02] The
San Francisco Chronicle concludes, ï¿½The FBI obviously knew something
was in the wind. ... The FBI did advise Ashcroft to stay off
commercial aircraft. The rest of us just had to take our chances.ï¿½
[San Francisco Chronicle, 6/3/02] CBS's Dan Rather later asks of this
warning: ï¿½Why wasn't it shared with the public at large?ï¿½ [Washington
Post, 5/27/02] ''

I guess you're talking about the X10kHz stuff. It's the foreign markets that have 9kHz channel spacing, so leaving off the last digit makes even less sense for them!

Look at a 60's/70's era "pocket transistor" AM radio. There's a little thumbwheel for the dial and there really is not room to write out the full frequency to the last kHz. A common notation was to write some of the leading digits bigger than others (although that was always confusing to me, especially because it was often done inconsistently.)

Tim.

Bingo. I think I recall some High Q tunable LC circuits in the front end. And yes, perhaps some of the energy coming in the power leads, but I wouldn't be so quick to call that a problem. Call it a design feature :) Anyway, yes, a nice receiver.

I'd like to suggest the Bearcat - Unden Line of scanners,
I have an older (1994) BC800XLT that covers
the complete 800 mhz band including
the cellular frequencies. It was made just
before the ban on cell frequencies on scanners . I picked it up
at a flea market for about $30 with the instruction
book. It's a desktop unit. UHF is best with an outdoor antenna in my
area.

Check universal Radio's used list, they always have a few scanners
there .
I would'nt buy a modified scanner, just my opinion.

Charlie

For very good quality receivers with manual tuning try an Icom 7100 or an AOR AR-3000A. Difficult but not impossible to find on the used market.

There is nothing I'm aware of new that allows manual tuning and includes full frequency coverage.

The fact that you would say that proves you have been programmed.
Gore never claimed to have invented the internet. He says he helped
get DARPA funding for the precursor of the internet.

If you want to survive, you'll need to become a more critical thinker
and a much better media consumer.

I wonder how this fits with the business models of the old REGIONAL powerhouses of the 70s such as CKLW and WABC. WABC always acknowledged their long distance listeners who called in, and CKLW certainly was NOT targeting only Windsor, ON.

Wrong again buckwheat. Here is a direct quote:

"During my service in the United States Congress, I took the initiative
in creating the Internet. I took the initiative in moving forward a
whole range of initiatives that have proven to be important to our
country's economic growth and environmental protection, improvements in
our educational system."

It may have been poor phrasing on his part, but those are his exact
words.

Those days are long gone. But remember, a jock acknowledging a long distance listener on the air, is and was even then, largely a novelty. It doesn't reflect what's happening in the PD's office with the Arbitron book, or how they compute rates for the Sales department.

Working in Chicago, having listeners in South Fox Crotch, Tennesee is good for the ego. Hell, I sat in for the night jock one evening at KWKH and took a request from Crayford, south of London. A great stroke. But hardly saleable. And in the US, Radio is always about the money.

Now, CKLW is not representative of what happens in radio in the US. At time to which you refer, radio stations in Canada were licenses to print money. There were more radio stations in Illinois than the whole of Canada, and the Canadian model for broadcast is vastly different than it is in the US, specifically because of the large unserved areas between radio stations. Not so much anymore, especially with all the AM's going away, migrating to FM or going dark. That kind of seals the deal on local vs. DX listener bases. But even in the 70's the Canadian model was not the same as in the US.

>Did he offer any references to support the many baseless statements like this: History shows that no nation can survive the tension, conflict, and antagonism of two or more competing languages and cultures<

Whether this is technically accurate or not, you surely have to admit that there is ample, piled-high-and-deep evidence that multiculturalism tends to create disunity, mistrust and violence. It doesn't matter whether it is one country with many cultures or many countries with varied cultures, it pretty much all leads to disaster after awhile.

Every continent is packed full of history of cultural conflict. I think it would be hard to find an example of two disparate cultures surviving happily side-by-side for very long before strife erupted.

This is not racism, it is not culturalism, it is not any kind of -ism. It is a reason why people of varying cultures who live together should be exploring the threads of commonality that bind their lives and their society, to look for the values that will help to improve everybody's lot, instead of the too-public diversity that sets people apart from one another and establishes the age-old "us vs. them" attitudes that rip us apart. Go ahead, retain your traditions and cultural identity within your families and religious structures, that's a fine thing to do - but when a part of a society, work to find the best in society, and support the structures that resulted in strength and security in the past. Without this attitude, the future may be neither strong nor secure.

A Yupiteru MVT-7100 goes up to 1.6ghz with manual tuning. You'd need to buy used or import one from Europe.

If you want something bigger - I've got an Applied Communications (aka Aiken or Norlin) SR-2150 that was built for the nsa. It's a 70 pound 3U rack mount radio with a built in plasma screen for the spectrum display. It covers 20-1200mhz with no gaps. When I get around to it, mine will probably end up on ebay. The cooling fan moves a lot of air, and it scares the cats.

no you just assumed again

I agree that what happen 89 affects today

but back in 89 I knew there would be some problem for us from our
actions in afgahanistan

you are on the flase assertion we need to know the future before we
can act today

did UBL get training etc for the US very likely. does this mean our
action was wrong? NO (nor does it mean we were right)

1293. Re: Lenoxx Sound

I think radios such as Lenoxx Sound and GPX and Sound Design (although they probally are made by the same factory/company) are much underated by some people.The ones I own are all very good,in my opinion.I once bought a Sangean 909 AM/FM/Shortwave radio from www.ccrane.com company.I remember inside of the back of the radio where the batteies go there was two tiny toggle/flip switches.One for 10KHz and one for 9KHz.I have known for many,many years 9KHz is for some foreign markets/countries.

You are saying something quite different from what Lamm is purported to
have said. And no, having more than one cultural group within a given
set of political borders does not always lead to disaster. What
happens in many instances is that the cultures take on characteristics
of one another over time. That is not to say that there is an equal
give-and-take, because one cultural group may for one or more reasons
dominate the other. Is the transition smooth and painless - no. But
the results are not always a disaster.

>
> Every continent is packed full of history of cultural conflict.

Conflict is one thing but disaster is something else entirely.

> I

They don't usually co-exist within a set of political borders without
taking on one-another's traits.

He didn't create the Internet because that was a Defense Department project started in 1969. Now, it is highly debateable what effect he had on the internet as we know it today considering that most of the development was started by Netscape, Microsoft and others.

IBOC is diffferent than AM stereo. First, I think we agree that the number of people who listen for "audiophile radio" is even smaller than the number of AM DXers. And IBOCs low bitrate won't satisfy the discerning ear, anyway.

But IBOC-FM is already multicasting in some markets, and I suspect there's the capability for IBOC-AM to multicast after ibiquity's anticipated analog shutdown. I have a further SWL paranoid nutball suspicion that pay radio is also among the cards up ibiquity's sleeve.

To continue with my wild ass guesses, I don't think multicasting, itself, will be a big deal. It would be as if Major League Baseball were to double the team rosters. The teams wouldn't get more stars and superstars, those guys are already in the big leagues. The teams would fill up the rosters from the bottom. So it might be with multicasting. The stations could fill in with some niche formats.

But, if CBS had their own pay radio scheme in place, they likely could have kept Howard Stern.

Yup, that's true, Darpanet was the first internet project as I
remember. But Al Gore clearly misspoke and overstated his
contributions.

Claim: Vice-President Al Gore claimed that he "invented" the
Internet.

Status: False.

Origins: Despite the derisive references that continue even today,
Al Gore did not claim he "invented" the Internet, nor did he say
anything that could reasonably be interpreted that way. The "Al Gore
said he 'invented' the Internet" put-downs were misleading,
out-of-context distortions of something he said during an interview
with Wolf Blitzer on CNN's "Late Edition" program on 9 March 1999.
When asked to describe what distinguished him from his challenger for
the Democratic presidential nomination, Senator Bill Bradley of New
Jersey, Gore replied (in part):
During my service in the United States Congress, I took the initiative
in creating the Internet. I took the initiative in moving forward a
whole range of initiatives that have proven to be important to our
country's economic growth and environmental protection, improvements
in our educational system.
Clearly, although Gore's phrasing was clumsy (and perhaps
self-serving), he was not claiming that he "invented" the Internet (in
the sense of having designed or implemented it), but that he was
responsible, in an economic and legislative sense, for fostering the
development the technology that we now know as the Internet. To claim
that Gore was seriously trying to take credit for the "invention" of
the Internet is, frankly, just silly political posturing that arose
out of a close presidential campaign. Gore never used the word
"invent," and the words "create" and "invent" have distinctly
different meanings ï¿½ the former is used in the sense of "to bring
about" or "to bring into existence" while the latter is generally used
to signify the first instance of someone's thinking up or implementing
an idea. (To those who say the words "create" and "invent" mean

exactly the same thing, we have to ask why, then, the media overwhelmingly and consistently cited Gore as having claimed he "invented" the Internet, even though he never used that word, and transcripts of what he actually said were readily available.)

If President Eisenhower had said in the mid-1960s that he, while President, "created" the Interstate Highway System, we would not have seen dozens and dozens of editorials lampooning him for claiming he "invented" the concept of highways or implying that he personally went out and dug ditches across the country to help build the roadway. Everyone would have understood that Ike meant he was a driving force behind the legislation that created the highway system, and this was the very same concept Al Gore was expressing about himself with his Internet statement.

Whether Gore's statement that he "took the initiative in creating the Internet" is justified is a subject of debate. Any statement about the "creation" or "beginning" of the Internet is difficult to evaluate, because the Internet is not a homogenous entity (it's a collection of computers, networks, protocols, standards, and application programs), nor did it all spring into being at once (the components that comprise the Internet were developed in various places at different times and are continuously being modified, improved, and expanded). Despite a spirited defense of Gore's claim by Vint Cerf (often referred to as the "father of the Internet") in which he stated "that as a Senator and now as Vice President, Gore has made it a point to be as well-informed as possible on technology and issues that surround it," many of the components of today's Internet came into being well before Gore's first term in Congress began in 1977.

It is true, though, that Gore was popularizing the term "information superhighway" in the early 1990s (although he did not, as is often claimed by others, coin the phrase himself) when few people outside academia or the computer/defense industries had heard of the Internet, and he sponsored the 1988 National High-Performance Computer Act (which established a national computing plan and helped link universities and libraries via a shared network) and cosponsored the Information Infrastructure and Technology Act of 1992 (which opened the Internet to commercial traffic).

In May 2005, the organizers of the Webby Awards for online achievements honored Al Gore with a lifetime achievement award for three decades of contributions to the Internet. "He is indeed due some thanks and consideration for his early contributions," said Vint Cerf.

From: "ve3..." <ve3iut@hotmail.com>
Message-ID: <1141924467.107958.152940@i40g2000cwc.googlegroups.com>
Source record: 66704

The number and length of some OT postings seem to be increasing to the point that some members are contemplating a moderated site. This would be an unfortunate last step as many of the group have eclectic backgrounds and their post, although off topic, make for interesting reading. I think that those OT posts that involve propaganda and tedious arguments of insidious intent should be discouraged. The best way to do this is not to answer them in any way. Psychological theory states that a message that is never responded to will not continue. Sniping at them, no matter how clever, only rewards the message and leads to more of the same. I am beginning to think that some of the authors of these OT post are paid by some agency as part of some disinformation sceme: otherwise why don't they ply their trade on the political science or economics sites where they can meet the heavy hitters? Has anyone noticed similar text on other websites that would indicate an agitprop operation?

There were some nice thunder storms last night that. I checked the rain gauge in the front yard this morning and even though the Pedernales electric company got a nice 1" doucher, the noise was still there this morning. I was hoping if it was the case of dirty insulators or something, the rain hy help by washing it off. but no dice.

I'm supposed to meet with them again tommorrow. - Matt

Right now, IBOC-AM is supposed to be limited to the daytime hours, although I seem to remember one of the stations in the early days of IBOC was transmitting IBOC well into the evening. It might have been WCKY. Anyway, that's the first time I heard that damn IBOC noise.

>You are saying something quite different from what Lamm is purported to
have said. And no, having more than one cultural group within a given
set of political borders does not always lead to disaster. What
happens in many instances is that the cultures take on characteristics
of one another over time. That is not to say that there is an equal
give-and-take, because one cultural group may for one or more reasons
dominate the other. Is the transition smooth and painless - no. But
the results are not always a disaster. <

No - not always. But it happens plenty. It has happened in the US at
least once, in 1860, and the cultures were not even especially diverse
- in fact, the only real difference was the economic model (which led,
of course, to an examination of a far more important problem). Europe
and Asia and Africa have been rife with rather nasty conflicts over the
last decade/century/millenium over cultural issues (often exacerbated
by the exhortations of those in power).

>> Every continent is packed full of history of cultural conflict. <<

>Conflict is one thing but disaster is something else entirely. <

One is a subset of the other, or at least the two have some common
components. A conflict can be a disaster, and can result in changes
that serve nobody's best interests, or worsen the conditions for one
side.

>> I
> think it would be hard to find an example of two disparate cultures
> surviving happily side-by-side for very long before strife erupted. <<

>They don't usually co-exist within a set of political borders without
taking on one-another's traits. <

...unless the prevailing message is to "celebrate diversity" and fully
retain one's own culture without examination of what is going to make
everything blend harmoniously - which, I fear, is the signal the US is
giving to people now. There is strong encouragement to give every

cultural tradition equal time (not in itself a bad thing), at the (intended or unintended) expense of the prevailing sentiment; and there is little suggestion that newcomers should adopt the status quo, at least publicly, to the extent that it is positive and stabilizing. The set of political boundaries may change as a result.

I would not expect any nation in the world to welcome me as a new citizen if I did not try with all my vigor to become a publicly conforming member of that nation's society - and I would not go there with any other expectation. I would learn the language, learn the customs and traditions of etiquette, tolerate the cultures and mores of the land, and learn to get along with people. This is completely rational, logical, and very nearly a common-sense matter - but those aspects of societal assimilation seem to have been totally lost on newcomers (to the US, at least) in the last 20 years or so. People refuse to learn English, refuse to be responsible for fitting in, and insist that their own specific whims and idiosyncracies be catered to, lest they feel discriminated against. They sometimes even expect that society should give up its status quo to serve their new "needs." I don't think this is going to be positive in the long run, because it ultimately sets up that "us-vs-them" attitude, and ignores the positive aspects of life (and there are very many) in the new nation that are worth emulating.

>> This is not racism, it is not culturalism, it is not any kind of -ism.

ABC owned WLS, WMVP (ex-WCFL) and WRDZ (radio Disney) are on the licensed, but not yet operating, IBOC list:

http://www.ibiquity.com/cgi-bin/liststations?state=IL

I've noticed WLS's AM stereo has been working inconsistantly on my car radio. I haven't been listening all that often, but I seem to remember WLS normally broadcasting in AM stereo except when playing network programming such as Rush Limbaugh or Art Bell.

Anyway, US radio hobbyists can track the IBOC plague here:

David said that Gore said: "Gore never claimed to have invented the internet. He says he helped get DARPA funding for the precursor of the internet."

When in reality Gore said: "During my service in the United States Congress, I took the initiative in creating the Internet. I took the initiative in moving forward a whole range of initiatives that have proven to be important to our country's economic growth and environmental protection, improvements in our educational system."

His words stand on their own...much to his never ending distress. And as usual you have missed the boat. Go reread what he is widely quoted as having said. He may have meant something different, but it was not what he spoke.

Yes, but we got past it and survived so it was not a disaster. And the
cause of the Civil War was not disparate cultures warring over a way of
life. It was fundamentally over states rights vs federal rights.

Europe
> and Asia and Africa have been rife with rather nasty conflicts over the

The single biggest impediment to assimilation is religion. If you look
back over time one can find zealots in virtually all religious beliefs

that in the name of their religion did some very nasty things to those
who were different in one way or another.

>

The immediate value of celebrating diversity is that we can not pick on
one another because we come from different backgrounds, but try to work
together to allow the assimilation process to work over time. Look at
all of the cultures that have accumulated in the U.S. and they have
been or are being assimilated. And what constitutes an american is
continuing to change.

> We're at war!

Rickets, you wouldn't know a war if it crawled up your mentally ill, drug
addled ass and decided to spend the winter.

In other words, you're a delusional, jaw flapping 'tard boy, who'd run to mommy
the first time the 'war' came anywhere near you, because chances are,
you'd be one of the first casualties (i.e. you're a useful idiot).

>Yes, but we got past it and survived so it was not a disaster.<

You and I will need to differ here. It caused unbelievable suffering and grief, and in my mind, that's disaster.

> And the cause of the Civil War was not disparate cultures warring over a way of life. It was fundamentally over states rights vs federal rights. <

I agree on the cultural part - but there was a significant economic model difference between north and south, with cultural twist as a result, and without it, the conflict of rights would not have arisen.

>The single biggest impediment to assimilation is religion. If you look back over time one can find zealots in virtually all religious beliefs that in the name of their religion did some very nasty things to those who were different in one way or another. <

I won't argue there - as you note, it is the zealots (which in another frame of reference are leaders) who exhort their practitioners to do evil to others. However, in the modern US case, I don't think that this is biggest factor - not yet, anyway.

>The immediate value of celebrating diversity is that we can not pick on one another because we come from different backgrounds, but try to work

together to allow the assimilation process to work over time. Look at all of the cultures that have accumulated in the U.S. and they have been or are being assimilated.<

It is important, again, to note that when the earlier immigrants have some to the US, they have generally come with the intent to assimilate. My grandparents from northern Europe immediately began to learn the language, learn the customs, and become one with the society. Grampa still made lutefisk at Christmas time and ate smelly Norwegian cheese, but he worked hard to get along with everyone, including the other immigrants. He never expected the government to print information in Norwegian. He also never expected the government to give him a cent of welfare. He came with an ethic of hard work and determination, and made assimilation a priority because he believed it was right and proper, and also, obviously, a way to achieve success in a foreign land.

> And what constitutes an american is
continuing to change. <

Yes - now, the basic concept is disappearing, because people are starting to refuse to understand what it has meant traditionally to be

an american, and with it, I think, the ability to be a part of the heritage that has been established.

I am afraid of what is to come - not because I think change is necessarily bad, and not because the newcomers do not have blond hair and blue eyes - but because I am afraid that people of other cultures will not value what I think is important...like freedom of religion and speech; like personal responsibility for one's own actions and income; like compassion for others; like preservation of the environment and not overrunning the land and taxpayers' wallets with seething, smothering humanity. The nations and cultures they leave behind do not always seem to value these things (not that everyone aleady in the US does either, but at least the ethical tradition is there), and it is worth preserving by making sure the new arrivals understand this through a rigorous immigration and naturalization process.

Not in the U.S. But clearly in other parts of the world. The Catholic
Church, Church of England, Islamic Religion and many others all have
one thing in common: A less than pure background when it comes
persecution.

The assimilation of any national group into another does not happen
over night and it comes with some pain and is usually done more
grudgingly that happily. But it happens.

I'm sure you know that groups with blond hair and blue eyes are
minority themselves. I'm english/irish and have never my relatives
don't have those characteristics. And my lines are traceable back to
the early 1600's.

It's probably an urban legend. Somebody noted that it was published in the American Legion magazine, which doesn't really mean anything, even mainstream news outlets have been duped into reporting urban legends as factual news. In fact, a homogenous culture does not guarantee freedom from strife. The Mandarin Chinese have been at each other's throats for centuries, only ceasing when the Communists took over in 1949, despite having a common language and culture. Italy and Germany were only unified in the 1870s, despite having not only a common language and culture but in the case of Italy being geographically isolated.

Conversely, massive influxes of "strange" new immigrants does not guarantee civil strife. Two centuries ago, America was ethnically English and had only two religions: Puritanism and mainstream Anglicanism. As thousands of refugees from Europe arrived starting after the Civil War, the same concerns were raised then that you hear now. It was widely feared that these strange looking people with widely disparate languages and religious traditions would not assimilate and would tear America apart into ethnic enclaves. Political parties such as the Know Nothings, who were so paranoid that they were instructed to answer "I don't know" when asked about their movement by outsiders (hence the popular name of their party), sprouted up with the intent to keep America English. In California, considerable fear surrounded Chinese immigrants (ironic that Seeing Eye Dog is possibly of Chinese ancestry) who were walled off into isolated ghettoes or forced out of town entirely.

But the new immigrants eventually assimilated and were accepted by society. America did not become the Balkans. Massive new permanent underclasses were not created. As a former San Francisco resident, I can testify that the city's Chinese who have been in America for 150 years

are not totally "assimilated" as most people would think of it. They still speak Chinese at home; their children learn Chinese before they learn English. They retain their cultural traditions and uniqueness. Yet there is no Sino-American separatist movement that I am aware of, even though the CCP would probably like one to exist. The Chinese are not at war with the whites.

1342. Radiotalkkback in the Net

Newsgroup: rec.radio.shortwave
Date: 2006-03-09 19:50:04 UTC
From: "http://www.lookaboutusa.com/" <nswamfm@yahoo.com>

Source record: 66732

Author Topic: RADIO TALKBACK on the NET

Hi there

we are looking for a presenter or main host (work from Home anywhere
in Australia or NZ or anywhere) who is working at a station or not to
host a concept that we are putting together

If you are interested please send me a talking email of about 60 second
to

(typed as google groups do not show email address)
nswamfm at yahoo dot com.
There is a draft to have a look at at
http://www.radiotalkback.net/draft/index.html
Comments or ideas are most welcome from members of this group
We havent put it up on the domains of
http://www.radiotalkback.net
and
http://www.smsseek.com
yet but will sometime this week
I have to add links to all the main world Australian and New Zealand
Talkback stations
to the Page (2GB/3AW/ABC/1ZB 'Wooley Radio Live etc)
For content and item development there is a messageboard at

http://aussieseek.proboards25.com/

We will obtain a sponsor and knock it into a daily 7/24 end format
where it is downloadable on the net and for use by commercial and
community stations in Aus/NZ where we pay the stations to carry it.. I
have the use of a satelite for the pacific
so send/end is not a problerm
In submitting to the ACMA I also think it could be a narrowcast format
in a 3 Hour loop
changed daily but am out of touch with 2006 Narrowcasting and any
advice or support would be appreciated
In two words
please help !!!

Keith

Well its not sideband after all,probably speech inversion of a sort.
a BFO did not make it more or less intelligible. I can hear it in the car
over a 4 square mile area,the TIS at midway is very weak and barely makes
it off property at night..

Right, so some years back, some misguided youngsters found it
fashionable to collectively delude themselves into believing that these
number station recordings were suitable as some sort of "ambiance
music".

I suppose this sort of thing could only hold their attention spans for
a limited amount of time before they had to move on to something else.

1355. Re: Grundig S350 & S350DL

Newsgroup: rec.radio.shortwave
Date: 2006-03-09 21:41:17 UTC
From: wgmartin99@yahoo.com
Message-ID: <1141940477.800893.243250@i40g2000cwc.googlegroups.com>
Source record: 66745

Everyone who is contemplating buying a Grundig/Eton S350 or S350DL or
who already owns one, and especially anyone thinking of buying one used
off eBay
or from a dealer, should be aware that there has just been a dramatic
change
in the list price in recent weeks.

It appears that Eton/Grundig has reduced the list price on the
S350DL radio from $150 to $100 (and also the list price on the
YB550PE from $100 to $80). I had gotten a catalog from a
mail-order dealer who I did not consider to be a source of radios
(Siegler & Co.) that had some Eton radios in it, and was
surprised to see the S350DL at only $99.95. I went through
a series of contacting them to verify that it was really the
S350DL and not just the S350, and they assured me that it
really was the S350DL. I had a 10%-off on-line order discount
code and so I ordered one. Since I thought that this was
a really surprisingly good deal, I also notified Hauser's "DXLD"
Yahoo group and the SWPrograms mailing list about this.

Then I happened to actually *read* the print in Eton's ads
in PopComm and noticed that the February and March '06
ads show the list price of the S350DL now to be $100,
and they no longer listed the old S350. The Feb '06 MT
still has the old Eton ad with the S350DL at $150 list and
the S350 at $100; I haven't gotten the March issue yet.

Anyway, this certainly affects all the S350 and S350DL owners
and sellers and prospective buyers, and also makes it much
less advantageous to get the Tecsun version! I did a quick
Google search just now and see that many sites are still selling
these at the old higher prices, and it seems that the news
about the new lower prices has not propagated widely.

This should drive the price of any remaining new S350s still on a
dealer's shelf down to maybe $50 as a discontinued close-out, and
also cause the prices of any used S350s and S350DLs on eBay
or used-radio-dealer sale lists to plummet! Also much wailing
and gnashing of teeth amongst those who bought these
radios at the old price, I expect. A similar effect on YB550PE
prices, too.

So I hope the info can be spread among the SW-radio community.

Also, I took a look at the www.etoncorp.com website --
BOTH the S350 and S350DL are listed on it at $100 list price each!

The YB550PE, which is in the current ad in PopComm at the new lower price of $80, isn't mentioned at all!

73, Will Martin

They work well in a low local noise location.

A random or long wire could be a good reference antenna against a new
design.

Guess ill have to wait for a goverment auction, thanks for the info i
will put Applied Communications on my list of when i win the lottery
radios, along with Watkins Johnson. Anyway there is a large hamfest in
Charlotte NC this weekend & i needed some input just in case
there would be some high end scanners or uhf receivers there.

Consumer advocates and internet rights groups are especially concerned about AT&T chief executive Edward Whitacre's outspoken resistance to the principle of "network neutrality," a standard that ensures all users can access the content or run the applications and devices of their choice without discrimination from internet service providers.

"I think the content providers should be paying for the use of the network," Whitacre told the Financial Times earlier this year. "Now they might pass it on to their customers who are looking at a movie, for example. But that ought to be a cost of doing business for them. They shouldn't get on [the network] and expect a free ride."

In December, BellSouth's William Smith told reporters that he would like to turn the internet into a "pay-for-performance marketplace," where his company could charge for the "right" to have certain services load faster than others.

What this would mean for you is higher costs, fewer choices and less control.

AT&T, Verizon, Comcast and others could block you from viewing a favorite podcast or blog, cut off internet phones unless we use their service, or force you to download MP3s from their company store by slowing access to outside music sites. The profit motive of a few corporations would supplant the freedoms of all users, determining which features end up shaping our digital future.

These types of corporate schemes discriminate against those of us who rely on the internet as an accessible tool to spread new ideas, spark innovation and encourage dissent.

Perhaps you could narrow the search a bit:
radio telephone, beacons, aeronautical, navigation, navy, military etc.
There are many different categories to explore, such as coast guard rescue operations, automated weather stations, marine radiotelephone (WNO New Orleans used to have a station even I could hear up here in washington <s>). Coast guard communication area master stations are quite powerful (CAMSPAC Pt. Reyes California and CAMSLANT Chesapeake are two I know of). Then there are the numbers stations and communications of various covert military and government agencies. GHFS (Global High Frequency System)is not covert but they use coded messages to communicate with air force aircraft world wide.
I'm sure many who post here could enlarge on these categories :)

The CONET CDs started off as a permanent record of Cold War radio, my recordings being the major bulk of the CDs. Some musos and members of the chattering classes in the USA, notably the head of Aquarius records, deemed it a form of ambient music. I have never considered it so.

If everyone ignored the nut jobs it would not matter if they kept
posting here or stopped at some point. The nut jobs are not the problem.
The problem is people responding to the nut jobs.

Kill filing is the passive approach, which would be a complete solution
if not for people responding to them.

Complaining about them to their provider to get their accounts
terminated is the aggressive approach.

I would take the aggressive approach but the people that like to torment
the nut jobs would complain that I took away their fun so I stick with
the passive approach.

I found a way to fine tune the kill file so I generally don't see the
Troll OR responses to the Troll. If I toggle the filter off and respond
to the Troll myself my own response along with anyone else will be
killed when I toggle the filter back on. Works great for cleaning up the
news group posts. 99% of the crap is automatically deleted. Only takes a
few seconds to generate a filter for a new Troll. Then just re-filter
the days posts so you only have to see them once and the rest of the
crap goes away.

Get a good news reader with flexible filters and you will be in good
shape despite the nonsense in the news group.

I was using ILG, which says it is directed to central America. The
target is written eCA so Cuba would be a good bet.

I don't know about the programming, which could very well be meant for
Cuba.

Telamon, I'm curious, what news client do you use? I've not figured out how
to configure Outlook Express to filter responses to those in my killfile;
perhaps it can't be done.

Yes, currently listening to it on 6135.

> I expect it is jammed so at
> least you and I would hear the jamming.

I can hear the jamming underneath, but it's fairly weak here and not annoying at all. If I switch to the W-E antenna I don't hear the jamming at all.

It's fairly certain that the transmission(s) originate in Europe, some supposedly via the UK.

You need to use a dedicated news reader. I don't know how to use Outlook
Express for reading news. I just use it for mail. The Mac version of
Outlook is called Entourage on the Mac.

If I turn on the header information it shows the line below on one of my
posts.

User-Agent: MT-NewsWatcher/3.4 (PPC Mac OS X)

On your post it's

X-Newsreader: Microsoft Outlook Express 6.00.2900.2180

Well I use a Mac as you can tell from the header information and my news reader is MT-NewsWatcher.

There has to be many free news readers for PC's. Don't use a mail program for Usenet.

Thanks, I'll check it out. Probably should have just googled it first, but I
was feeling unusually lazy. I actually just picked up a Mac this past
weekend; this is my first experience with that os.

LOL,

You're funny.

I think the only limit is local zoning laws and if it's really high, a blinking light so airplanes don't fly into it.

Remember, most of the time in receiving, bigger is better.

I like my IC 7100 too. Switching out different receivers on the same
outdoor antenna, the 7100 receives best of all I own.

For just ham band stuff, My ts-790 tribander does better I think. There is
a mod and a location for an extra connector on the 790 to allow it to
receive 800 mHz.

As you said in your first sentence, people will argue about it. I agree with what you say.

My point is that when you use a tuner with a receiver, it's acting as a bandpass, which is the cause of the improvement if the receiver needs front end help, Unwanted signals affecting the AGC are reduced. Impedance matching with a tuner on HF I don't think you hear a difference. Maybe we're meaning the same thing but saying it different ways.

I imagine any height will work; HF radios of WWII were common in our
aircraft.

The only limits depend on how close you are to an airport; antenna
heights are regulated around flight paths.

Have you ever seen the movie "Contact" <s> ? Radio waves that are not reflected and ultimately attenuated into nothingness by the atmosphere (the electromagnetic radiation becomes heat) end up travelling through space forever . My answer is, the higher the better. Consider that some waves get caught in a "conduit" in the atmosphere and flow around the globe. That can be thousands of feet up. If you have a conductor in the air that gets hit by an electromagnetic wave, it will travel to your receiver if connected <S>. On the other hand, if you have a storm in the area, at least disconnect that wire LOL. You would need to be tuned to the right frequency of course unless the signal is so broadband (lightening for instance) that it impacts a large band of frequencies. Spark gaps are famous for radiating energy in a strong signal all up and down the shortwave bands.

Ultimately, the wire could be many miles long. The levels of the atmosphere ionised can be miles up. That accounts for why some signals are audible at one time in the day and not during other times. The atmosphere is ionised and coalesces into layers during the day and the layers later dissipate. Radio signals are bent by the ionised layers and emerge from the layers at various angles. The signal may bounce over long distances or short depending on how high the layer is. It is a matter of the angle at which the signal encounters the layer.

The behavior of charged particles can be a lot like magnets. As it happens, charged particles behave predictably in the presence of magnetic fields. A magnetic field will distribute particles charged one way or another. Negatively charged particles go one direction, and positively charged particles go another. If the magnetic field in an environment is strong enough, it wreak havoc on a wave. The magnetic field of the earth is getting weaker, and it may soon be the case, that there is more than one magnetic north pole, and one magnetic south pole. This makes shortwave reception a whole new ballgame.

All life all holiness come from you O Lord

The Summer 2006 Kol Israel / Israel Radio schedule has been
posted on the IBA's website at:

http://www.iba.org.il/reception/index.asp?classto=Shortwaves

All time listed are Israel Standard Time (NOT UTC).
Israel changes to Summer Time (1 hr ahead) from March 31 to Oct 1. The
IBA
website says the clock changes back Sep 28, but other sources say
differently.

The PDF version of the schedule on that page, is still the Winter
2005-2006 schedule for the time being.

I'm sure that www.israelradio.org will be updated soon.

I'm hearing a domestic program from ABC Radio in Australia on 7355 at 01
to 03-ish UTC.
Does anyone know which station might be transmitting (relaying) this?

Tnx,
Bill

I have them both. The ICOM sure looks sexier, but they are both nice radios The AR300A is more portable, though you can run the icom from 12V if you build a cord. [The power connector is an off the shelf Molex.] The AR3000A has a funny power connector. It ships with a wall wart and a plain cable going to pigtails, so you can also run it from 12V IF that cable hasn't been lost by the original owner.

The AOR can do some very strange stepping. It only comes in handy on the old (and maybe still active) "air phones". Basically the AOR can set the step and an offset. For example, if you wanted to hit 100.1, 101.1, 102.1, etc .you could set a 0.1Mhz offset and a 1Mhz step. I need to check to see if the Icom can do that.

The Icom 7100 can output 10.7Mhz to a panadapter

If you listen to this recording (win amp required since it is ogg vorbis)
http://www.lazygranch.com/sound/redflag/feb2006/tues_ogg.ogg
the Icom 7100 was the right channel, and the AR3000A was the left channel. However, it is not a fair contest as the 7100 was on a UHF blade antenna mounted on the roof of my SUV, while the AR3000A was on a Diamond RH77C inside the SUV.

Both the 7100 and the AR3000A have a line level output. The AR3000A needs a funny DIN connector cable that I built but didn't use for the recording. My recollection is the AR3000A line output was unsquelched, but I'm not sure. I know the Icom 7100 line output is squelched.

I don't know the current price for the AR3000A, but I got the Icom 7100 for $400 about two months ago. I've seen the Icom 8500 go for around $700, which is also a good deal as it is newer and a bit higher in bandwidth, plus fair HF performance.

For mil air, both these radios have reasonably high frequencies first mixers (around 700Mhz), so they produce few mil air birdies.
.

1408. (Tedious OT Post) 'Mom,' 'dad' to be axed from Calipornia textbooks?

Newsgroup: rec.radio.shortwave
Date: 2006-03-10 02:40:30 UTC
From: SeeingEyeDogg <look@u.org>
Message-ID: <1211psdjvl3t30b@corp.supernews.com>
Source record: 66798

A Calipornia bill pending in the Legislature, if approved, could remove all references to gender in public schools • threatening even references to "mom" or "dad" in textbooks.

If the bill, SB 1437, were to become law, "it could potentially require gender-neutral bathrooms in our schools and all references to 'husband' and 'wife' or 'mom and dad' removed from school textbooks as the norm."

Supported by Dr. DaviD and sponsored by Democratic Sen. Sheila Kuehl • a lesbian actress best known for playing Zelda in "The Many Loves of Dobie Gillis" in the '60s • the legislation would add "gender" (actual or perceived) and "sexual orientation" to the law that prohibits California public schools from having textbooks, teaching materials, instruction or "school-sponsored activities" that reflect adversely upon people based on characteristics like race, creed and handicap.

"The reason this is such an outrageous bill is because it is the most extreme effort thus far to transform our public schools into institutions that disregard all notions of the traditional family unit. SB 1437 seeks to eliminate all 'stereotypes' of the traditional family so that young children are brainwashed into believing that families with moms and dads are irrelevant."

That is exactly what the good book of Communism teaches.

When I am up a tall ladder working on my house,when I get done I usually just throw my tools down on the ground.Last year I throwed down a pair of pliers.When I got down off my ladder,I couldn't find them anywhere.I know they bounced off of the concrete steps of my concrete front porch but I still couldn't find them where I thought they had dropped.A few months later my old buddy was over here and he saw them laying in the flower bed in front of my concrete front porch,of course by that time they were all stiff and rusty.

But CKLW's target was the US, not Canada at all, and they made no
bones about it. I'm sure they were in Windsor rather than Detroit
because of costs, but their target audience was south of the border.

For that matter, last time I was in San Diego (quite some time ago,
actually), the dial was packed with stations in Mexico targeting SD.

When I was new to the hobby, I didn't know much about getting good height to SW longwires. As a result, I used to make like a monkey and climb trees....tall trees...rather than throwing them or slingshotting. Once when I was about 30 feet up a blackjack tree and nervous about the height, I was putting the final ties from the wire to the tree when all of a sudden a transformer blew up just down the block. It was so loud I dropped the wire before it was secured and fell about halfway down the tree landing on my side. I looked around after I got over the shock and peering at me was a large snake (not sure what brand it was)....this made matters even worse. Since the wire was back on the ground plus the serpent staring at me motivated me to set a possible world record of descending a tree in probably less than 10 seconds. Not only did I lose the wire, I also came down with various scrapes, bruises, high blood pressure, and a very bad case of ego-kill....my wife and a friend were watching at the time. I believe that event led me to investigate better ways to install the high ends of wire antennas. Necessity is the mother of invention. I definitely climbed to new lows that day.
Thanks for bringing up this topic because I hadn't thought of that in a LONG time.....it's good to laugh at yourself. In other words, don't take yourself too seriously. Took me a long time to get that concept down.

You make my point for me. Again, the target audience is of limited size. Because there's no practical sales value beyond a certain point. Audience for CKLW is for practical purposes outside of the ADI, unmeasurable. Where there is a measured audience, it's small compared to the locals, and not saleable. But even if it were comparatively large, and I've worked in markets downstate where WLS and WGN were rated and contenders against the locals, there still wasn't a practical sales value. So, for all intents that matter, that audience isn't a consideration. Hence IBOC interference issues outside of the ADI are not a consideration. If you're going to argue objectionable interference, it has to be within the ADI.

As for the CKLW target. Practically speaking, the were a Detroit station. And they sold the Detroit market. Nonetheless, they were a Canadian station, and different rules, different business models apply than those for US stations. Targets are one thing. Rules are another. And location determines the rules. Not targets.

One of the things that's easily forgotten, is that Radio is an entertainment business. (loose definitions apply.) What you hear is often not really what it seems. There's a lot behind the curtain that is intentionally not on display before the listening audience. Meaning that what you hear is often not what you get.

A long distance dedication is a great ego boost to the jocks at the station and the PD running the show. It's great to have your name smeared across multiple states.

But as a practical business tool, it's only an imaginary benefit. The business model is something quite different. And practical realities far more limited than what's implied to those on your side of the grille cloth.

If people haven't made a big deal of it here on RRS, I suspect it's because of you. I'm sure that many readers of RRS who dislike Bush would not criticize him here simply because they don't want to seem to support your neverending deluge of off-topic postings. And for that I thank them!

Also, very few people share your absurd belief that SW DXers have a key role to play in the political future of this nation. Most folks come here because they want to discuss SW-related topics.

Recently received an email from this gay fellow "Starsky Darksky" who has this Sierra Poo-Poo thing going on. He wants any of the gay (homosexual) dx'ers to contact him at:

darksky@ecenet.com

He says he's in central Minnesota and wants to hook up with any Gay Dx'ers who are into that kind of thing. He mentioned something about how much he likes to "pack fudge" in his email to me, but I'm not sure what that means.

The Rodent Revolution has, for the record, pretty much stayed clear of the Central Minnesota area, for this very reason. Most of the people are gay, in one way or another. Example, Garrison Kellor. Nuff said! Now we have this Starsky guy, who is keying up on other pirates and trying to establish this gay "chit-chat" thing. It would appear he's one of these monkey radio wannabe's, who is obsessed with hearing himself on a two-way radio. You know the type!

What you monkeys do to each other is of no concern or worry to Rodents. I find all of you monkeys to be revolting, disgusting and low class, and can't imagine why you'd find each other attractive, especially those of the same sex, but then I've come to learn, that monkeys, for lack of anything better to do, will play with that appendage, hanging down for lack of something productive to do! Unlike us superior Rodents who use it to reproduce in great numbers, accomplishing two things. 1-extreme pleasure 2-make more Rodents to overthrow the monkeys.

In fact, let me encourage you Gay monkeys, like Starsky Darksky to practice your gay lifestyle, as it will leave less of you to do away with because: 1-you can't reproduce 2-you'll die from disease 3-your interior decorating is obnoxious 4-limp wrists sink ships!

Is there any way one of you monkeys can get Jay Smilkstein this guys email, and hook them up? This Starsky Darksky and Jay look like a match made in Kulpsville!

Thanks for your email Starsky, hope you're getting the attention and promotion that you wanted from your email to me. Apparently, having a hissy fit at Bubba's truck stop in St. Paul didn't work for you. Ah, monkeys, you're so funny!!!

TJ's is a godsend - they have fabulous unique stuff, low cost, and lots of it. One problem, however, is that they refuse to locate in a district where less than a minimum percentage of the population has a college degree (it's pretty high, too - something like 50%) and that means blue-collar neighborhoods miss out (like mine, f'rinstance). Surely the demographic on this can't be so important that Regular Joes wouldn't appreciate and scarf up their goodies...it isn't as though their prices are too high.

Oh, well - eventually I'll live in a town where only PhDs reside and then I can have a TJs near me...

THE BOOTLEGGER

A bootlegger walks into a radio store and tells the salesman that he would like to buy the new HF rig over in the corner. The salesman says, "Sorry, we don't sell to bootleggers". He leaves, goes home, puts on a brown wig and sunglasses and goes back to the store and tells the salesman he wants to buy that new rig over in the corner. Sales guy says, "Sorry, we don't sell to bootleggers". Old boot asks, "How do you know I'm a bootlegger?" and the salesman replies, "Because that's not a rig, it's a microwave oven."

Radio, currently a synonym for "electromagnetic radiation", actually first came into use before Heinrich Hertz's proof of the existence of radio waves. Originally "radio" was a general prefix meaning "radiant" or "radiation" -- hence the term "radio-activity" for the alpha, beta, and gamma rays emitted by decaying atoms. In Europe, some of the persons investigating Hertz's discovery began using the "radio-" prefix -- for example, in 1890 Edouard Branly in France called his receiver a "radio-conductor", the October 24, 1902 issue of The Electrician (London) included an article titled "The Radio-telegraphic Expedition of the H.I.M.S. 'Carlo Alberto'", and a report in the November 19, 1904 Electrical Review about Belgium marine applications noted that "radio-telegraphy has entered into the domain of current practice".

RHF Wrote:

>John S. proclaims -
"The single biggest impediment to assimilation is religion."

The Irish were mainly Catholic and Assimulated
over time into the American Culture.

The Italians were mainly Catholic and Assimulated
over time into the American Culture.

So then why would 'you' make the Mexicans
who are also Catholic out to be non-assimilable
because of their Religion ?

Many {Most} Immigrants from all Nations who came to
the USA seeking a Better Life were Persons-of-Faith :
Why Did Their Religion Fail to Prevent Them from
Becoming Part of the Fabric of the American Culture ? <

My impression, and I could be wrong, was not that John was pointing out a potential conflict between Christians - the only place this seems to be important is Ireland - but rather between religions who really have fundamental differences, like Islam and Christianity and Judaism - or Hindus and Muslims, for example. The Protestants and Catholics in the US never really had any reason for a major turf war, as far as I can recall - at worst it was a kind of a Cold War analogy, and nowadays that even seems to have evaporated (except with the Evangelicals, who I have heard bad-mouthing Catholics periodically).

Furthermore, I also never got the impression that he was pointing out that Mexicans, as a result of their religion, were going to have trouble. In fact, I think he was actually responding to my assertions about Mexican (and other) culture generally conflicting with established US culture - and I wasn't really speaking of religion anyway (you probably saw what my concerns were in another post). As I suggested, religion has never been the big problem in the US - more often it has been either purely racial, or cultural differences that may have been secondary to race.

As I said, diversity in itself is not a problem, and I think this is true of religion too - as long as everyone recognizes that our Constitution guarantees your freedom while you tolerate those of others. I am afraid that as the diversity grows, however, one or more groups with substantially different ideas will try to assert their

"moral rights" to change a system that, historically, has been quite positive and tending toward a philosophy of improvement for all and preservation of the good. That possibility is disturbing.

I agree - although as you well know, those gas prices keep on keepin' on...

My own drive is only five miles, but through traffic and incessant stoplights it's about 20 minutes each way. I rarely go there unless there's some other reason to be nearby...and then I stock up on the goodies.

We were hopeful that we'd get one in our local heavily settled area, where a commercial district was/is being redeveloped - but TJs said we weren't good enough - not enough of those AA/BA/BS/MA/MS/ScD/PhDs :-(

Ah, you're obviously a Trader Joe's newbie.

Heisenberg's Coffee of Uncertain Blend was sold by Trader Joe's in the 80's and at least through the mid 90's. It was supposedly made of beans that had undocumented heritage. Interesting stuff, and really cheap too.

I faintly picked up Voice of Korea (the name used by the North Korea
broadcaster) last month and mentioned it in my reception reports here:

http://tinyurl.com/esaaz

The broadcast was designed to make its listeners happy, not worry about
anything, and to love Kim Jong-il.

Current English schedules are available at
http://www.primetimeshortwave.com/

Good luck picking it up. It's a bizarre experience.

1484. Buying a Sony ICF SW7600GR radio from a seller on Ebay in the US.

Date: 2006-03-10 18:01:36 UTC
From: Bob <rj@sympatico.ca>
Message-ID: <4411BF00.4786FAC0@sympatico.ca>
Source record: 66873

BTW Before anyone says anything I do realize that I could have
prevented these
excessive charges by simply not dealing with this seller.

I bid $129 on a Sony ICF SW7600GR radio from a seller on Ebay.
The seller charged me $41 shipping. (I priced return
shipping via UPS, it is
$16.29)

The seller advertised shipping to Canada by Fed Ex. When asked
to ship by US Post Office
(because the brokerage fee is only $4.30) he failed to respond
and shipped the
item via UPS??.

When the package arrived I was faced with an additional $33.62
brokerage fee
from UPS for having collected $18.89 tax on the goods and $2.36
tax on the
tax (total $54.87)

My total cost was $224.87
($129+$41+$33.62+$18.89+$2.36)

Had I chosen a different seller my cost could have been $168.48
($129+$16.29+$18.89+$4.30)

You live and learn. (or) A fool and his money are soon parted.

Vermont Town Backs Bush Impeachment

By DAVID GRAM
Associated Press Writer

NEWFANE, Vt. --

In a white-clapboard town hall, circa 1832, voters gathered Tuesday to conduct their community's business and to call for the impeachment of President Bush.

"In the U.S. presently there are only a few places where citizens can act in this fashion and have a say in our nation," said select board member Dan DeWalt, who drafted the impeachment article that was placed on the warning -- or official agenda -- for the annual town meeting, a proud Yankee tradition in New England.

"It absolutely affects us locally," Dewalt said.

"It's our sons and daughters, our mothers and fathers, who are dying" in the war in Iraq.

The article, approved 121-29 in balloting by paper, calls on Vermont's lone member of the House, independent Rep. Bernie Sanders, to file articles of impeachment against the president, alleging that Bush misled the nation into the Iraq war and engaged in illegal domestic spying.

The impeachment item came at the end of a roughly four-hour meeting that was devoted mostly to the local affairs of the town of 1,600.

Among the other items discussed was whether the town should fix some of the 100-year-old sidewalks in the village.

The impeachment discussion took up almost half an hour, reflecting the intense interest in the topic and something of a division over whether the town meeting was the appropriate place to debate it.

Ann Landenberger argued that it was appropriate.

"As a teacher I can't say to my kids that what happens on the national level doesn't affect us at the local level," she said.

"Would that we could all be in a cocoon, but that is not the case."

Nuclear Madness

By BOB HERBERT

The key to understanding the Bush administration and its policies is contained in the widely cited New York Times Magazine article, "Faith, Certainty and the Presidency of George W. Bush," by Ron Suskind.

That's the article in which Mr. Suskind described how a senior Bush adviser contemptuously dismissed the community that most of us live in, "the reality-based community."

The times have changed and reality isn't what it used to be.

As the adviser explained, "We're an empire now, and when we act, we create our own reality."

This mad-hatter thinking was on display again last week.

President Bush, who used specious claims about a nuclear threat to launch his disastrous war in Iraq, agreed to a deal -- in blatant violation of international accords and several decades of bipartisan U.S. policy -- that would enable India to double or triple its annual production of nuclear weapons.

The president turned his back on the Nuclear Nonproliferation Treaty (dismissed, like reality-based thinking, as passï¿½) and moved the world a step closer to an accelerated nuclear arms race in Asia and elsewhere.

In the president's empire-based, otherworldly way of thinking, this was a good thing.

For decades, U.S. law and the provisions of the nonproliferation treaty have precluded the sale of nuclear fuel and reactor components to India, which has acquired an atomic arsenal and has refused to sign the treaty.

President Bush turned that policy upside down last week, agreeing to share nuclear energy technology with India, even as it continues to develop nuclear weapons in a program that is shielded from international inspectors.

"I'm not saying we wouldn't get our hair mussed, Mister President,
but I do say not more than ten to twenty million dead depending on the
breaks."

General "Buck" Turgidson in Dr. Strangelove

1489. For Sale Eico 667 Tube Tester

Newsgroup: rec.radio.shortwave
Date: 2006-03-10 19:24:49 UTC
From: leslocklear@cableone.net
Message-ID: <1142018689.057560.194870@z34g2000cwc.googlegroups.com>
Source record: 66878
Cross-posted to: rec.antiques.radio+phono,rec.radio.shortwave,rec.radio.amateur.boatanchors

This tester was rebuilt and calibrated in January, 2005 by the late Chris Haedt who was considered by many to be the "Professor of Tube Testers."

It is a late model 667 without the built in roll chart, has a full manual copy and repair report and calibration sheet from Chris.

Extremely clean, no longer needed here as I have cleaned out the boatanchors. It will not test the older 4 pin tubes.

This is a solid state unit and very reliable. It is a dynamic conductance tester.

$100 plus shipping/insurance.

Les Locklear
Gulfport, Ms.

Iran's Best Friend

At the rate that President Bush is going, Iran will be a global superpower before too long.

For all of the axis-of-evil rhetoric that has come out of the White House, the reality is that the Bush administration has done more to empower Iran than its most ambitious ayatollah could have dared to imagine.

Tehran will be able to look back at the Bush years as a golden era full of boosts from America, its unlikely ally.

During the period before the Iraq invasion, the president gave lip service to the idea that Iran and Iraq were both threats to American security.

But his advisers, intent on carrying out their long-deferred dream of toppling Saddam Hussein, gave scant thought to what might happen if their plans did not lead to the unified, peaceful, pro-Western democracy of their imaginings.

The answer, though, is now rather apparent:

a squabbling, divided country in which the Shiite majority in the oil-rich south finds much more in common with its fellow Shiites in Iran than with the Sunni Muslims with whom it needs to form an Iraqi government.

Washington has now become dangerously dependent on the good will and constructive behavior of Shiite fundamentalist parties that Iran sheltered, aided and armed during the years that Saddam Hussein ruled Iraq.

In recent weeks, neither good will nor constructive behavior has been particularly evident, and if Iran chooses to stir up further trouble to deflect diplomatic pressures on its nuclear program, it could easily do so.

There is now a real risk that Iraq, instead of being turned into an outpost of secular democracy challenging the fanatical rulers of the Islamic republic to its east, could become an Iranian-aligned fundamentalist theocracy, challenging the secular Arab regimes to its west.

Fast-forward to Thursday's nuclear deal with India, in which President Bush agreed to share civilian nuclear technology with India despite its nuclear weapons programs and its refusal to sign the Nuclear Nonproliferation Treaty.

This would be a bad idea at any time, rewarding India for flouting the basic international understanding that has successfully discouraged other countries from South Korea to Saudi Arabia from embarking on their own efforts to build nuclear weapons.

But it also undermines attempts to rein in Iran, whose nuclear program is progressing fast and unnerving both its neighbors and the West.

The India deal is exactly the wrong message to send right now, just days before Washington and its European allies will be asking the International Atomic Energy Agency to refer Iran's case to the United Nations Security Council for further action.

Iran's hopes of preventing this depend on convincing the rest of the world that the West is guilty of a double standard on nuclear issues.

Mr. Bush might as well have tied a pretty red bow around his India nuclear deal and mailed it as a gift to Tehran.

All together now...THANK YOU, MR. PRESIDUNCE

Icom handheld scanners have always been less than optimal radios due to
intermod problems. If you were to get a handheld, I'd go for the
MVT7100. [Yeah, got one of those too.] The only drawback to that radio
is the goofy battery holder, and of course a lack of computer
programming.

Yes exactly!!

The truth is that I know better but I got carried away. I bid before I had read all the shipping rules. The seller does ship via US post office for troops at APO addresses so my request was not impossible. I suppose he was greedily looking at the ($41-$16.29) = $24.71 profit he could make by shipping by UPS. On top of that he just didn't give a damn if by doing so it cost me (his client) the $24.71 that he snared plus an extra ($33.62-$4.30) = $29.32 to UPS for brokerage.

The seller's got a good business going with almost 41000 sales and not to many complaints so I never dreamed he would actually do what he did.

We live and learn. I guess after dealing with soldiers all my life (37 years) I have a thing or two to learn about business people.

What that I see on the horizon.???
Could it be.??
Yes it is , it's a new Peter Puffer Radio show , starring Starsky
Rumprider
aka CB savage...
It must really suck to be Starsky...
Such a meager existance , but not for long ..
I have a feeling you'll be famouse real soon..
Fruit l00p you doubted me last time , and you got all kinds of air
time,
infact you were relayed coast to coast...
So sit back slug, you and your lil'peter puffer good buddies ,listen to
your radio and enjoy the shows...
You really need to learn not to fuck with old pirates....Do you know
what happens when you fuck with old pirates?
You Loose...

The ebay fee is based on sales price, which does not include shipping.
Hence these assholes charge high shipping fees to increase the net. If
there is any question about shipping cost, establish this before the
purchase.

In the US, USPS shipping depends on where you go. There are some retail
outlets that take USPS shipments at a marked up rate.

You need to be very careful with ebay. Almost always I get better deals
elsewhere. I was at a local surplus shop and ran into an ebay peddler
getting items to sale. Well, at least that is more legit than
Radio-Mart(TM), where he gets items from Ebay and writes lies to get a
higher price when reselling on ebay.

Sure we do David, at the same time a person should be able to deal on Ebay if he chooses to do so.

I don't really "get" what it is that you are driving at.

I thought you got better. Oh well. Keep tryin'.

In the meantime:

You can shine you're shoes
And wear a suit
You can comb your hair
And look quite cute
You can hide your face
Behind a smile
One thing you can't hide
Is when you're crippled inside

You wear a mask
And paint your face
You can call yourself
The human race
You can wear a collar
And a tie
But the one thing you
Can't hide is when you're
Crippled inside

Well now you know that your
Cat has nine lives babe
Nine loves to itself
But you only got one
And a dog life ain't no fun
Mamma take a look outside.
You can go to church
And sing a hymn
Judge me by the color
Of my skin
You can live a lie until you die
One thing you can't hide
Is when you're crippled inside

Crippled Inside

Yes but there is very little of that around here, and the local Sony stores are selling this radio at $329.00 plus $49.35 tax which makes that about a total of $325.38 US$

> I was at a local surplus shop and ran into an ebay peddler

The K7RA Solar Update

SEATTLE, WA, Mar 10, 2006--A big news story this week (big to us, anyway) generated more email than I've ever received. If you were one of the kind folks who sent in an alert about a new prediction for sunspot cycle 24, I'm sorry that I couldn't get back to everyone.

A new computer model of solar dynamics produced by scientists at the National Center for Atmospheric Research (NCAR) predicts the next solar cycle to begin a bit later than had been thought, but to rise much higher,--perhaps by as much as 30 to 50 percent--than the current solar cycle just ending. The model claims to predict cycles 16-23 with 97 percent accuracy using earlier data. For those yearning for another Cycle 19 of the 1950s--one that I missed--50 percent higher would just about get us there!

The NCAR news page has a report. So does the NASA Web site. Another article from Science@NASA claims the Cycle 23 solar minimum is already here--or at least the beginning of it. Thanks to the multitude of hams who wrote regarding this prediction for the next solar cycle.

As for current propagation, solar activity remains low, with many recent days of zero sunspots and even more ahead. The vernal equinox (ie, spring) is only a couple of weeks away. This is a good time for HF propagation, even with few sunspots, as the Southern and Northern hemispheres are equally bathed in the sun's radiation. Friday, March 10 could
have unsettled to active geomagnetic conditions, with unsettled conditions on Saturday, quiet to
unsettled on Sunday, and quiet on Monday, March 13.

Bob Poortinga, K9SQL, of Bloomington, Indiana, writes about his experience on 15 meters last
week during the ARRL International DX Contest (SSB). He ran 100 W into a wire antenna--he
wasn't specific--and worked 44 countries.

He reports: "Highlights included 2 JAs (heard two others), Tonga, Ascension Island, and three
KH6s. Also heard, but did not work, VK6NS and a ZL1 station. Had lots of QSOs to South
America, mostly Argentina and Brazil. The Pacific opening lasted about two hours, occurring
about 2130-2330 UTC Sunday. The three KH6s were worked within 15 minutes of each

other,
and I did not hear them again".

Bob likes the BeaconSee software for monitoring NCDXF/IARU beacons. "I can't say enough
about this program," he says. Check it out!

Mark Schreiner, NK8Q, of Allentown, Pennsylvania, wrote to say how much fun he is having at
the bottom of the cycle running QRP, and how great the lower part of the HF spectrum is with so
little solar activity.

"About 1-1/2 hours after local sunrise I heard 3D2NB on 40 meters on March 3, and once I
figured out the QSX, I worked him within a matter of a couple of calls. I was amazed to hear a
station at such great distance so late after local sunrise! I had worked a Fiji Islands station who
was barely copiable by me (so I can't imagine how my signal was for him unless his antenna
was something special) early last summer at about 5 AM during the peak of gray line, just before
my local sunrise, but to work this station so late after sunrise and with at least an S5 to S7
signal strength at my end, I thought was absolutely amazing!"

Warren Ziegler, K2ORS, now has the call sign once held by broadcaster Jean Shepard. As
WD2XGJ, Warren experiments with longwave transmissions on 137.8 KHz. Look at the cool
stone tower where he operates his station. The site has other photos and information about his
VLF equipment.

For more information concerning propagation and an explanation of the numbers used in this
bulletin see the ARRL Technical Information Service Propagation page. An archive of past
bulletins is on the ARRL Web site.

Sunspot numbers for March 2 through March 8 were 0, 0, 13, 28, 27, 25 and 24, with a mean of
16.7. 10.7 cm flux was 76.1, 75.5, 75, 74.2, 73.6, 74.4, and 72.4, with a mean of 74.5. Estimated
planetary A indices were 4, 4, 3, 2, 8, 12 and 4, with a mean of 5.3. Estimated mid-latitude A
indices were 4, 2, 1, 1, 8, 6 and 3, with a mean of 3.6.

Well Yes!! If you know about them, and their prices are competitive, sure! Why not? I also found an Ebay seller from Canada selling the radio which would allow me to avoid all the importation BS and I think I could pick it up right at his home, but I did not see that until after I had committed to buying from the first seller.

As I said earlier, I simply bid in to much haste and have only myself to blame.

>I have a 666. What's to calibrate?

Two pots inside, with a VOM across the AC primary transformer tap and set to 130VAC with the line-adjust pot. One pot is then set to full meter deflection (adjacent to the filament selector switch), the other to 1/2 meter deflection (adjacent to the line-adjust pot) with various buttons pushed. Takes 10 minutes apart from removal and installation into the case. Did mine last night.

Does not have sockets for pre-octal tubes, but does run well up into the compactrons and nuvistors. And it lists a lot of the pre-octals on the chart, so there must be adaptors available. Calls itself a "dynamic conductance" tester. Weight is about 12 pounds, or so. Not overly large. Good, easy-to-read meter and very easy-to-roll tube chart. Eico has a reputation for errors on its early tube charts, BTW.

Now to trace a niggly little fault, and intermittent to boot... the worst kind. I expect it is a bad connection combined with a wire-or-two out of place so that the problem only shows on occasion.

If I get it fixed, this one will go at Kutztown. I snagged it as the price was right, but it is not a keeper... and of the three I have, it is the least appealing. The other two do the older tubes as well.

Dear Bob,

We all live and learn. WHENEVER I buy something I always try to
remember P. T. Barnum's sage comment!

In future, should you wish to import SW equipment into Canada, consider
buying from AES - < http://www.aesham.com > - a very reputable dealer
whom you can telephone toll-free and who will ship into Canada by
whatever means you desire, thereby minimizing your shipping costs.

Universal will also ship into Canada; however, I believe they will only
ship via UPS which, as you may know, causes some "problems" (and costs)
with shipment into Canada.

An English firm which ships to Canada at reasonable fees (and which
also has low prices) is THE SHORTWAVE SHOP.

Best of luck in the future and best of luck with your new Sony
ICF-SW7600GR.

Joe

I think it has more to do with the Zip Code surveys they occasionally
take at the checkout. Los Angeles is the biggest manufacturing center
in the country and lots of upscale folks with no degrees.

I've never heard it. They have a broadcast to Western NAm, but I'm
usually asleep. I'd try South Korea under whatever name they're
currently using (was Radio Korea Intl, now apparently calling themselves
KBS) for Korea conflict news. South Korea has the most to lose from
their northern neighbor's brinksmanship, so I'd expect them to cover the
conflict rather well. North Korean broadcasts are totally disconnected
from any semblance of reality. At least Radio Havana sometimes reports
actual international news items.

Well, if one is really afraid, one should live in a lead lined chamber 20 feet into solid granite <s>. Just remember that neutrinos and cosmic rays are probably more powerful. Neutrinos can fly unimpeded through the earth and out again by the billions. Also, since the earth's magnetic field is weakening rapidly, more auroras are possible and so is brain damage from the radiation thereby capable of reaching us through that weakened field. Not to worry, it could be thousands of years yet before the poles change LOL.

Thanks Joe

I really don't need much of anything else now. I bought a Sony CFR 320 back in about 78 in Europe and did not use it much after I returned in 82. Anyway, I got listening to it again this winter and it still works beautifully. My wife bought me a Grundig 350s to listen to in the kitchen and I just loved it's selectivity but the one I had could not keep time, so I returned it and read a few posts about the 7600GR and looked around for this one.

I kind of like the look of this Eton E1XM and may opt to buy one. I think that it may be a little simpler to tool around the band with then the 7600GR. I like presets, but so far I am finding the page system of the 7600GR just a little awkward. I know that as I become more familiar with it things will get easier.

Well OK better run!

Take care.

Hi Dave

Well I got into machining after I retired and I found Ebay a wonderful source
for so many things that you just could never find by your self in a non industrial
city and I have come to appreciate Ebay buying.

I got screwed on this deal because I was to lazy to follow all the common sense
checks that I should have. I did not do my homework.

Thing is, that it's not to late to remind others.

Ha ha ha ha

Well John, I can't say that I didn't know it as coming. Really ,, I
told my story because I am so pissed at myself that I can hardly see straight and
putting things on paper helps get rid of the anger. I can lose a few bucks but I'll
be damned if it's going to drive me to a heart attack. (O:

I wish I could blame the seller but he was just another greedy little man who set up
his site to snare the unsuspecting, and he caught me. All our politicians seem to be
crooks and the Enron guys are crooks. Our country was run by crooks for 13 years and
your country went to war with a nation based on lies. I can hardly blame one little
Ebay seller for the "moral decay" of the our society!

Cheers

It seems to me that some time back someone was enquiring as to when Libya's Voice of Africa broadcast in English.

I've twice now received the Voice of Africa in English on 7320 kHz in the 5 mins or so before 0:00 UTC (broadcast from transmitters in France). Decent signal in the mid-Atlantic region of the U.S., although some mild interference from WHRI on 7315 kHz (nothing your sync detector can't clear up). And at 23:59 or so Radio Austria chimes in with some hefty interference on 7325 kHz.

Better pull out the shortwave radio. There's no guarantee that in the future, Americans will still be able to see dissident websites. Extending that logic, there's no guarantee that BBCWS will continue to be available on satellite radio, or that certain satellite TV transmissions will remain free of US government meddling. Shortwave radio is nearly impossible to block, however, unless you're dealing with a small area. The CCP has found it so hard to ensure reliable jamming coverage of China that they've resorted to handing out fixed freq radios to villagers on the pretext that they're new and improved. For a country of America's size, effective jamming would be impossible.

SW plays a critical role in conveying information that cannot be communicated any other way. Do North Koreans listening to RFA have any influence over Kim Jong Il? Do Chinese factory workers listening to Sound of Hope have any influence over the CCP? No, but SW is a lifeline to the outside world for them and many others. In that sense SW IS important. I know that SW cannot compete in the average American's all-digital world-for now. But if/when the digital pipeline is restricted/controlled/censored, SW will suddenly become very important.

> consideration.

Actually, what I've gotten from this discussion is that even if the
tracking methods -- 800 numbers, "Mention you heard it here on...,"
etc. have all shown that there are listeners all beyond the target
areas. What happens is that the sales department doesn't like data
that doesn't fit their assumptions, and dismisses it out of hand.

> Hence IBOC interference issues outside of the ADI are not
> a consideration. If you're going to argue objectionable interference, it
> has to be within the ADI.

I don't think anyone is arguing against that point now. I think,
however, there is a lot of dismay among readers and posters that the
sales people are working with a model that doen't fit reality. They
then target their sales in exactly that way -- the local pizza joint
is of no use to a Miami listener, but J&R Music World certainly would
be.

It seems to be a self-perpetuating... myth, for lack of a better word.
Especially today, when people are more than willing to do commerce
cross-country for normally local items such as used cars.

...and back in the 70s, certainly there was absolutely no excuse for
not knowing your coverage pattern. WABC was a clear channel station,
back when there were clear channels. Why have the clear channel
status if not for the coverage area?

> As for the CKLW target. Practically speaking, the were a Detroit

IMHO, the IBOC debacle will be as harmful to AM radio as the
elimination of clear channel designations. Some bureaucrat with the
heart of a calculator is going to wonder why ad revenue is dropping,
all the while looking at unchanging numbers massaged to fit his faulty
model his coverage area.

Recently received an email from this gay fellow "Starsky Darksky" who has this Sierra Poo-Poo thing going on where he is encouraging "CB'ers" to get on HF and destroy the HF band like they did the CB band. Anyways, he wants any of the gay
(homosexual) dx'ers to contact him at:

darksky at ecenet.com

(the @ was taken out because it wasn't coming out on google, so monkeys, when you see "at", it really means @)

He says he's in central Minnesota and wants to hook up with any Gay Dx'ers who are into that kind of thing. He mentioned something about how much he likes to "pack fudge" in his email to me, but I'm not sure what that means.

The Rodent Revolution has, for the record, pretty much stayed clear of the Central Minnesota area, for this very reason. Most of the people are gay, in one way or another. Example, Garrison Kellor. Nuff said! Now we have this Starsky guy, who is keying up on other pirates and trying to establish this gay "chit-chat" thing. It would appear he's one of these monkey radio wannabe's, who is obsessed with hearing himself on a two-way radio. You know the type! Sad, lonely, desperately wanting attention, willing to get on his knee's for any monkey who will give him the
attention he so desperately wants and needs.

What you monkeys do to each other is of no concern or worry to Rodents.

I find all of you monkeys to be revolting, disgusting and low class, and can't imagine why you'd find each other attractive, especially those of the same sex, but then I've come to learn, that monkeys, for lack of anything better to do, will play with that appendage, hanging down for lack of something productive to do! Unlike us superior Rodents

who use it to reproduce in great numbers, accomplishing two things. 1-extreme pleasure 2-make more Rodents to overthrow the monkeys.

In fact, let me encourage you Gay monkeys, like Starsky Darksky to practice your gay lifestyle, as it will leave less of you to do away with because: 1-you can't reproduce 2-you'll die from disease 3-your interior decorating is obnoxious 4-limp wrists sink ships!

Is there any way one of you monkeys can get Jay Smilkstein this guys email, and hook them up? This Starsky Darksky and Jay look like a match

made in Kulpsville!

Thanks for your email Starsky, hope you're getting all the attention and
promotion that you wanted from your email to me. Apparently, having a

hissy fit at Bubba's truck stop in St. Paul didn't work for you. That truck driver think
just isn't working out for you, is it monkey-boy?

Ah, monkeys, you're so funny!!! Sad, but funny!

I've dated a few women from China - one of them told me how she used
to have a radio that let her listen to Voice of America and that
kindled her desire to leave China. Just a point of reference.

They were in Windsor because they are a Canadian station, not a US one. And
the costs of operating from Canada were supposedly higher, due to the taxes,
goverment regulations and such in Canada.
>
> For that matter, last time I was in San Diego (quite some time ago,

There are only a handful of stations in Tijuana targeting SD in English, and
one or two more in Spanish. Most are content to serve one of Mexico's ten
largest cities.

> elimination of clear channel designations.

The clear channels continue to exist. The Roman numerals used to designate them changed to letters, but other than that WABC and WGN and KFI et. al. are still 50 kw non directional clears.

The change is that few listen to the clears outside the local groundwave coverage area any more. There are FM signals in all but the most barren parts of the US, and there is little listening to AM at night anyway.

> Some bureaucrat with the
> heart of a calculator is going to wonder why ad revenue is dropping,
> all the while looking at unchanging numbers massaged to fit his faulty
> model his coverage area.

Radio revenue is increasing faster than inflation. The former I-A and big 1-B clears without exception are billing leaders in their markets and are increasing in revenue because their local signals are strong, not much affected by interference and they have good talk based programming. WBZ, WTIC, WGY, WHAM, WSB, WBT, WSM, WGN, WBBM, WSCR, WHAM, WLW, KDKA, KYW, WABC, WFAN, WCBS, KMOX, WWL, WOAI, WBAP, KRLD, KOA, KSL, KOB, WFAB, KFI, KNBR, KGO, KNX, KIRO, WHO, WCCO, etc. are all among the nation's highest billers.

Actually, it's a lot less sinister than that. It's that there are not sufficient numbers of them to be saleable to advertisers. The fact is that few people actually listen to any given station out of the local coverage area. Skywave listening is still going on, but not in saleable numbers. There is no mechanism for selling a widely scattered irregular, unmeasured audience. For an audience to be saleable, it needs to be measured, and fall in to the correct demographic, psychographic, and geographic areas. A zip code with less than 100 listeners, is statistically zero. A zip code with an unreliable signal is of no value. Believe me, if the numbers supported it, WLS would have a sales office in Shreveport, Louisiana. But the only one regularly listening to WLS in Shreveport, was me, in 1984. There were a half dozen of my friend in St Louis, who listened to WLS. Most of them were in Radio. Most would prefer to listen to KXOK. The signal was stronger, clearer, and more reliable. Even in the 60's there only pockets of listeners to skywave activity. Widely scattered, occasional listeners are of no statistical presence. And not saleable.

The bottom line is that there's a bottom line. And anything that
can't materially affect it is not considered.

That's the nature of Radio in the US. It's always about the money.

>
>> Hence IBOC interference issues outside of the ADI are not

> however, there is a lot of dismay among readers and posters that the
> sales people are working with a model that doen't fit reality.

Actually, the sales people are working the ONLY reality: That the
only listeners that matter are the ones that are saleable. In the US,
Radio is always, and has always been about the money

They
> then target their sales in exactly that way -- the local pizza joint

> It seems to be a self-perpetuating... myth, for lack of a better word.
> Especially today, when people are more than willing to do commerce
> cross-country for normally local items such as used cars.

People are willing to do business cross country. And advertisers buy
national radio. But radio is SOLD according to local numbers. Skywave
numbers are not statistically present, nor practically operable.
Literally, to few, to far between to be useful.

Look at it this way: Radio has two customers, listeners and
advertisers. The job of the guy on the air is to sell the listeners to
the advertisers. To set the price, the guy on the air needs to have hard
numbers...how many are listening, in which zipcodes, at what times, in
what demographic groups, and for how long. And then those numbers are
compared to the advertiser's target customer in the zip codes in which
the advertiser does the bulk of his/her business. There are other
factors, for the purpose of this illustration, these are the important
ones.

Now, say you have listeners 400 miles away, well out of the
groundwave, and well into skywave. How many do you expect there to be in
any give zip code? 10? 100? If the conversion ratio of sales to
impressions is 1 in 10, that means to buy that station, one could expect
between 1 and 10 sales to result from a given period's advertising. 1 in
10 is very optimistic. So,the cost/benefit ratio is too high for that
buy. Now in the case of a mail order business such as, taking your
example, J&R, yes a clear channel station could produce a few sales here
and there though skywave listening, but consider, that the numbers,
again, are small compared to the local audience. And it's the size and
listening frequency of the local audience that sets the rate for the J&R

buy. Again, there is no statistical benefit to including the skywave listener. Making any measurement of the skywave audience prohibitively expensive.

Either way, they don't matter in the real world of Radio. Because they produce no revenue enhancement.

>
> ...and back in the 70s, certainly there was absolutely no excuse for
> not knowing your coverage pattern. WABC was a clear channel station,
> back when there were clear channels. Why have the clear channel
> status if not for the coverage area?

Clears were established when radio was in it's infancy. When audience measurements were clumsy, and before the psychographic nature or listening was understood. Those were also different times. Like the 60's and 70's when Radio was in its adolescence, Radio use was not the same. Programming was done through much different means, often by people who did not really understand the potential of the medium. Today, Radio is a mature product. And it's programmed and sold in a much different way than it was then. With unjustifiable expenses cut (and some justifiable ones as well) and among those, are the catering to the skywave audience.

And a lot of what was going on when you were hearing long distance dedications on CKLW was show biz. It may or may not correspond to the reality of the business model. A definite perception was catered to, there. But that's all it was: a perception. Get a listener from South Fox Crotch, stroke them a little on the air, send a post card, and a t-shirt. Play up the strength of the station as a national powerhouse. While what really mattered, What ONLY mattered was the local ratings. LOCAL. Because they were saleable.

What you hear on the air is showbiz. Bigger than life. More important than God. But that's just the show.

King Kong is still only 3 foot 6.

>
>> As for the CKLW target. Practically speaking, the were a Detroit

> model his coverage area.

Actually, his model gets more accurate every day. What changes is the
amount of effort he's willing to put forth to serve it. Truth is that
few Radio Executives recognize any benefit to doing things the hard
way...or the expensive way. When cheap and simple sells just as well....

And it's always about the money.

Interesting. The data sheet refers to the 'base loading assembly'
which does not surprise me - was almost thinking of it like a 10 - 12
meter 5/8 wave except it has no radials. I think I'll let somebody
else try it and read their comments on it's performance; for some
reason it reminds me of the adage "if something seems to good to be
true......."

Sounds pricey for a 6 foot vertical whip antenna. You could get a CB
vertical whip for a lot less I think.

Here is your mobile CB 102 inch long steel whip (8.5 foot) for $20 plus
$2 for shipping and handling.

The problem you may have run into is bandwidth. The DRM signal is wide
so you need to use a very wide filter or none at all. How wide the
signal is depends on the quality mode its in. I think you need at least
12 KHz or wider for all the DRM signal to get through.

wrote:

>bourgeois

In the early Middle Ages, as cities were forming, growing and
emerging, artisans and tradesmen began to emerge as an economic force.
They formed guilds, associations and companies to conduct business and
promote their own interests. These people were the original
bourgeoisie. In the late Middle Ages, they allied with the kings in
uprooting the feudalist system, gradually becoming the ruling class in
industrialised nation-states. In the 17th and 18th century, they
generally supported the American revolution and French revolution in
overthrowing the laws and privileges of the absolutist feudal order,
clearing the way for the rapid expansion of commerce.

Concepts such as personal liberties, religious and civil rights, and
free trade all derive from bourgeois philosophies. But the bourgeoisie
was never without its critics; it was first accused of
narrow-mindedness, materialism, hypocrisy, opposition to change, and
lack of culture, among other things, by persons such as the playwright
Moliï¿½re. The earliest recorded pejorative uses of the term "bourgeois"
are associated with aristocratic contempt for the lifestyle of the
bourgeoisie. Successful embourgeoisement typically meant being able to
retire and live on invested income.

With the expansion of commerce, trade and the market economy, the
bourgeoisie grew in size, influence and power. In all industrialized
countries, the aristocracy either faded away slowly or found itself
overthrown by a bourgeois revolution. Thus the bourgeoisie rose to the
top of the social hierarchy. This, coupled with the advances of
industry, resulted in the birth of an entirely new lower class, the
proletariat or working class. And, increasingly, criticisms of the
bourgeoisie began to come from below.

Another way of saying it's not an amplified, "active" antenna.

The most common use of the term tractor is for the vehicles used on farms. The farm tractor is used for pulling or pushing agricultural machinery or trailers, for ploughing, harrowing and similar tasks.

The first mechanized farm implements in the 1800's and early 1900's were steam tractors. These were built around steam engines, which were not very safe and could explode or entangle their operators in the belt driven attachments. These machines were phased out during the 1920s in favour of the increasingly popular internal combustion engine.

The classic farm tractor is a simple open vehicle with two very large driving wheels on an axle below and slightly behind a single seat (the seat and steering wheel consequently are in the center) and the engine in front of the driver with two steerable wheels below the engine compartment. This basic design has remained unchanged for a number of years, but enclosed cabs are fitted on almost all modern models, for reasons of operator safety and comfort.

There are also lawn tractors. John Deer, Toro and Husqvarna are famous brands who make them.

On modern farm tractors there are usually four foot-pedals, for the operator, on the floor of a tractor. The pedal on the left is the clutch. The operator presses on this pedal to disengage the transmission for either shifting gears or stopping the tractor. Two of the pedals on the right are the brakes. The left brake pedal stops the left rear wheel and the right brake pedal does the same with the right side. This independent left and right wheel braking augments the steering of the tractor when only the two rear wheels are driven. This is usually done when it is necessary to make a tight turn. The split brake pedal is also used in mud or soft dirt to control a tire that spins due to loss of traction. The operator presses both pedals together to stop the tractor. For tractors with additional front-wheel drive this operation often engages the 4-wheel locking differential to help stop the tractor when travelling at road speeds.

The pedal furthest to the right is the foot throttle. Unlike in automobiles, it can also be controlled from a hand-operated lever ("hand throttle"). This helps provide a constant speed in field work. It also helps provide continuous power for stationary tractors that are operating an implement by shaft or belt. The foot throttle gives the operator more automobile-like control over the speed of the tractor for road work. This is a feature of more recent tractors, older tractors often did not have this feature. When travelling on the road in the UK it is mandatory to use the foot pedal to control engine speed.

Power and transmission

Modern farm tractors employ large diesel engines, which range in power output from 18 to 500 horsepower (15 to 400 kW). Tractors can be generally classified as two-wheel drive, two-wheel drive with front wheel assist, or four-wheel drive (often with articulated steering). Variations of the classic style include the diminutive lawn tractors and their more capable and ruggedly constructed cousins, garden tractors, that range from about 10 to 25 horsepower and are used for smaller farm tasks and mowing grass and landscaping. Their size-especially with modern tractors-and the slower speeds are reasons motorists are urged to use caution when encountering a tractor on the roads.
A PTO shaft plugged into a tractor.
Most tractors have a means to transfer power to another machine such as a baler, slasher or mower. Early tractors used belts wrapped around pulleys to power stationary equipment. Modern tractors use a power take-off shaft (PTO) to provide rotary power to machinery that may be stationary or pulled. Almost all modern tractors can also provide external hydraulic and electrical power.

Most farm tractors use a manual transmission. They have several gear ratios that, generally, provide a range of speeds from less than one mile per hour up to about 25 miles per hour. Older tractors usually require that the operator depress the clutch in order to shift between gears (a limitation of straight-cut gears in the gearbox), but many modern tractors have eliminated this requirement with the introduction of technologies such as continuously variable transmission. This allows the operator more and easier control over working speed than the throttle alone could provide.

Slower speeds are necessary for most operations that are performed with a tractor. They help give the farmer a larger degree of control in certain situations, such as field work. However, when travelling on public roads, the slow operating speeds can cause problems, such as long queues or tailbacks, which can delay or aggrevate other road users. To alleviate conditions, some countries (for example the Netherlands) employ a road sign on some roads that means "no farm tractors". Some modern tractors, such as the JCB Fastrac, are now capable of much more tolerable road speeds of around 50 mph.

Safety

Modern tractors have rollover protection systems (ROPS) to prevent an operator from being crushed if the tractor rolls over. This is especially important in open-air tractors where the ROPS is a steel beam that extends above the operator's seat. For tractors with operator cabs, the ROPS is part of the frame of the cab. Before ROPS were required many farmers died when their tractors rolled on top of them. Row-crop tractors, before ROPS, were particularly dangerous because of their 'tricycle' design with the two front wheels spaced close together and angled inward toward the ground. Many farmers were killed by rollovers while operating tractors along steep slopes. ROPS were first

required by legislation in New Zealand in the 1960s.
Applications

Farm implements can be attached to the rear of the tractor by either a drawbar or by a three-point hitch. The three-point hitch was invented by Harry Ferguson and has been a standard since the 1960s. Equipment attached to the three-point hitch can be raised or lowered hydraulically with a control lever. The equipment attached to the three-point hitch is usually completely supported by the tractor. Another way to attach an implement is via a Quick Hitch, which is attached to the three-point hitch. This enables a single person to attach an implement quicker and put the person in less danger when attaching the implement.

Some farm-type tractors are found elsewhere than on farms: with large universities' gardening departments, in public parks or for highway workman use with blowtorch cylinders strapped to its sides and a pneumatic drill air compressor permanently fastened over its power take-off.

Precision agriculture

Space technology has found its way into down to agriculture in the form of GPS devices, and robust on-board computers installed as optional features on farm tractors. These technologies are used in modern, precision farming techniques. The spin-offs from the space race have actually facilitated automation in plowing and the use of driverless drone tractors that work in tandem with manned tractors on large corporate-scale farms.

Yeah, we learned a similar valuable lesson when buying a china platter from a UK seller. We didn't ask the cost of shipping before pressing the bid button and shipping almost doubled the price of a serving platter.

It sounds like your seller expected more in the way of bids and is compensating himself to a degree. Customs brokerage fees and duties are just adding to the pain. I've heard similar stories from other Canadians, and I think the best advice is to line up the cost of shipping before pushing the bid button.

You can take some consolation in being the owner of one of the nicer portables available. Enjoy it.

The explanation of profit maximization is rather depressing. Three
items of note are: (1) CKLW was ordered by the CRTC to cease and
desist in its whoring of the Detroit market and to follow Canadian
broadcast regulations. It complied and is now serving Windsor as a
less profitable operation. (2) CFRB (Canada's First Rogers Batteryless)
is a private station but has operated CFRX (6070) to serve the
boondocks
for at least half a century. As the skip lengthens out at night, it is
heard
all over the world. How does this fit the business model of maximum
profits?
(3) More and more stations are simulcasting on the internet. Why are
they
doing this if it doesn't maximize profits in their trading area?
It is amusimg that so many listerers who jeered at the BBC method
of financing the radio service are now rushing to pay the satellite
broadcasters $10 to get commercial-free programs. I am afraid that
quality programming will get lost in all this maximum profit drive.
Will the vast wasteland sound any better in digital?

the blue razorblade does work. as a child i tried every detector scheme possible. you would be surprised what ridiculous things will work! how about old borax laundry soap? it works also! now i am sorry that i never tried a lost tooth! many of the off-the-wall detectors DID work but they required a HUGE signal..... not efficient enough for practical use.

1639. ATTENTION: Blind Left-wing Moonbats - Where are "your" Documents?

Newsgroup: rec.radio.shortwave
Date: 2006-03-11 16:09:31 UTC
From: SeeingEyeDogg <look@u.org>
Message-ID: <1215tlcapu74a6e@corp.supernews.com>
Source record: 67030

"Able Danger" = Negroponte

...only some 3 percent of the 2 million captured documents have been fully translated and analyzed.
...
Left unanswered was what the analysts made of the Iraqi official who reported to Saddam that components of the regime's nuclear program had been "transported out of Iraq." Who gave this report to Saddam and when did he give it? How were the materials "transported out of Iraq"? Where did they go? Where are they now? And what, if anything, does this tell us about Saddam's nuclear program? It may be that the intelligence community has answers to these questions. If so, they have not shared them. If not, the tapes are far more than "fascinating from a historical perspective."
...
The documents found Thursday and Friday in a Baghdad office of the Mukhabarat, the Iraqi secret police, indicate that at least five agents graduated Sept. 15 from a two--week course in surveillance and eavesdropping techniques, according to certificates issued to the Iraqi agents by the "Special Training Center" in Moscow . . .

Details about the Mukhabarat's Russian spy training emerged from some Iraqi agents' personnel folders, hidden in a back closet in a center for electronic surveillance located in a four-story mansion in the Mesbah district, Baghdad's wealthiest neighborhood. . . .

Three of the five Iraqi agents graduated late last year from a two-week course in "Phototechnical and Optical Means," given by the Special Training Center in Moscow, while two graduated from the center's two-week course in "Acoustic Surveillance Means."

One of the graduating officers, identified in his personnel file as Sami Rakhi Mohammad Jasim al-Mansouri, 46, is described as being connected to "the general management of counterintelligence" in the south of the country. . . .

His certificate, which bears the double-eagle symbol of the Russian Federation and a stylized star symbol that resembles the seal of the Russian Foreign Intelligence Service, uses a shortened version of al-Mansouri's name.

It says he entered the Moscow-based Special Training Center's "advanced" course in "acoustic surveillance means" on Sept. 2, 2002, and graduated on Sept. 15.

Four days later, the Chronicle reported that the "Moscow-based Special Training Center," was the Russian foreign intelligence service, known as

SVR, and the SVR confirmed the training:

A spokesman for the Russian Foreign Intelligence Service (SVR), Boris Labusov, acknowledged that Iraqi secret police agents had been trained by his agency but said the training was for nonmilitary purposes, such as fighting crime and terrorism.

[Yeah, right]

Yet documents discovered in Baghdad by The Chronicle last week suggest that the spying techniques the Iraqi agents learned in Russia may have been used against foreign diplomats and civilians, raising doubt about the accuracy of Labusov's characterization.

Labusov, the press officer for the Russian Foreign Intelligence Service, confirmed that the certificates discovered by The Chronicle were genuine and that the Iraqis had received the training the documents described.

The Russians declared early in the U.N. process that they preferred inspections to war. Perhaps we now know why. Still, it is notable that at precisely the same time Russian intelligence was training Iraqi operatives, senior Russian government officials were touting their alliance with the United States. Russian foreign minister Boris Malakhov proclaimed that the two countries were "partners in the anti-terror coalition" and Putin spokesman Sergei Prikhodko declared, "Russia and the United States have a common goal regarding the Iraqi issue." (Of course, these men may have been in the dark on what their intelligence service was up to.) On November 8, 2002, six weeks after the Iraqis completed their Russian training, Russia voted in favor of U.N. Resolution 1441, which threatened "serious consequences" for continued Iraqi defiance on its weapons programs.

Maybe this is mere history to Negroponte. But it has practical implications for policymakers assessing Russia's role as go-between in the ongoing nuclear negotiations with Iran.
...
The intelligence community is not interested in releasing documents captured in postwar Afghanistan and Iraq. Why this is we can't be sure. But Pete Hoekstra offers one distinct possibility.

"They are State Department people who want to make no waves and don't want to do anything that would upset anyone," he says.

This is not idle speculation. In meetings with Hoekstra, Negroponte and his staff have repeatedly expressed concern that releasing this information might embarrass our allies. Who does Negroponte have in mind?

Allies like Russia?
...

> doing this if it doesn't maximize profits in their trading area?

The whole idea is t do this. Penetrate buildings in the local area where AM
and FM do not reach, and to expand the signal into nulls and shadow areas.
There is no interest in out of market listening.

- I prefer stranded insulated Wire; either solder the joints or
silicone glue them;

with supports frequent enough so it won't blow down (in normal winds)
and is " Ice Storm" proof..

Winding the insulated wire around a 3/4 inch nylon rope might also do
the trick

Multiple antennas are another idea..

- More ideas at the link below . . .

The article is tedious, but in a remote way makes a point. I find it
difficult to stay interested in the proceedings of what is really
nothing more than a glitzy mutual appreciation society. Watching the
movie industry give itself awards to prove that it has a social
conscience is pretty mind numbing stuff.

...and by pure coincidence, Israel wanted Iraq split into three parts, via civil war if necessary. Remember those bomb carrying English soldiers caught dressed as locals? Their job was to ensure the internal war broke out as soon as possible. Victorian England's secret service had done that for a hundred years in Europe. They kept the mainlanders fighting between themselves while they were out building an Empire.

I'm surprised the Iraqis fell for it.

Bullshit David!

Buy yourself some WIRE! Get a roll of #12 teflon coated that will last for years and not break if your neihbor farts in the same direction its hanging....#12 stranded will take a lot of bending and flexing with the wind. Believe it or not a #12 wire antenna is easier to tune and actually picks up better than the hair sized crap that reminds David of his penis diameter. Plus #12 is easier to solder on !.... At 30$ to 40$ a 500 foot roll its a great investment! It comes in green...brown...white...grey...red...blue...orange ect. so you can hide it no matter what.

I've done the #18 and # 22 Mistakes before.......Never again! I can break the stuff by stretching it with my bare hands.

If your not on lifetime public assistance like David?....go for the good stuff!

A 500-foot roll of #14 or #16 stranded insulated in your choice of
designer hues is available from Lowe's or Home Depot, about $25 if you
buy the whole roll.

Whilst in principle a broader cross section results in lower Q, the
diameters as a fraction of wavelength are virtually identical,
Asshole.

And a $500 foot roll of TFE coated wire costs way more than 30 or 40
clams.

And even worse, without a ground, the outer shield becomes part of the
antenna allowing noise p/u from inside the home, negating the advantage of
an outdoor mounting.

> statistical presence. And not saleable.
>

But that still misses the point. The idea is not to target
Shreveport, but to sell to a company that can target Shreveport,
Montgomery, Pensacola, Ft. Walton Beach, Huntsville, Birmingham, and,
yes, those of us like me in East Overshoe that just *might* be looking
for a reliable mail-order company in a large city that has the SLR I'm
looking for, because there are no local places to go.

Again, the idea isn't to sell pizza from Chicago to Huntsville. Or,
to sell Huntsville pizza on a Chicago radio station. The idea is that
there are advertisers who appeal to any location in a large geographic
area, such as J&R -- or any other business that sells mail-order --
and put their ads on the air.

I wouldn't be surprised if the 100 here and the 50 there over ALL of the skywave coverage area added up to between 5 and 10% of your listener area. Would *you* want to tell the PD that the latest Arbitrons showed a 5% drop in listenership in the evening?

But that is what you are doing -- assuming that the 5% is statistically insignificant because you are looking at it in terms of listener density per geographical unit.

...and its not like those listeners are costing you extra, in terms of station expenses -- you aren't increasing power for the benefit of those 5% -- you would, however, be selling to them an ad that is not targeted to a geographic area.

> The bottom line is that there's a bottom line. And anything that
> can't materially affect it is not considered.

But your model is flawed. It assumes that a low geographic listener density cannot be sold to, but that's only true for greographic-sensitive products, like pizza and the local bar or Olive Garden.

If that model was used on network television, there'd be no network TV ads, but there are. And somehow, network TV muddles on.

>
> That's the nature of Radio in the US. It's always about the money.
>

In this case, there's money to be made, even money being made, and it is ignored. You said yourself, earlier, that if I call in from East Overshoe and buy, say, that $1500 SLR, and say, "I heard it on WABC," they'll throw the data out rather than count it, because, *by itself*, it's statistically insignificant.

...except that there are 100 sales thrown out that way, and they are as an aggregate, statistically significant. All the East Overshoes don't get their own pie slice, but put into the "Other -- Skywave" slice, they are pretty big.

>
> People are willing to do business cross country. And advertisers buy
> national radio. But radio is SOLD according to local numbers.

And that is where the model is flawed.

> Skywave
> numbers are not statistically present, nor practically operable.
> Literally, to few, to far between to be useful.

...and I'm saying they are, but you'll never know selling pizza. But if you sell to a company that can take advantage of those distant areas, they will.

How many Hallicrafters radios would have been sold if they only
advertised in Chicago newspapers?

> Now, say you have listeners 400 miles away, well out of the
> groundwave, and well into skywave. How many do you expect there to be in
> any give zip code?

You don't. But if the local survivalist is the one with the program,
you sell the emergency preparedness web sites, Honda generators, and
enough colloidal silver to turn 'em all blue. Survivalists don't like
the city much, anyway.

Substitute "local survivalist" with "Art Bell" if you need a more
believable scenereo.

> 10? 100? If the conversion ratio of sales to

> expensive.
>
> Either way, they don't matter in the real world of Radio. Because
> they produce no revenue enhancement.
>

...that your model will measure. If it doesn't fit the model it's
thrown out, because the model doesn't reflect it.

You aren't spending extra dollars to get the signal to East Overshoe,
it's just there. Now that it is there, put something out there that
will be available and useful to any and all the East Overshoes out
there, no matter where they happen to be. Leave the zipcodes out of
it, unless you start binning all the zipcodes from your skywave
listeners according to the demographics they represent. You have one,
here, two there, five here, one over thar, all of which happen to be
middle class males 18-45 and add up to 100 sales. Not saleable?

I did a bad deal on ebay, but took my whoopin' like a man, or maybe a wuss. Basically, if you agree to the deal, you do it, even if you screw up. In my case, it was some used electronics gear that I thought was a slightly different model (same manufacturer). It was my fault, and thus I was obligated to finish the transaction.

However, I have been screwed by jerks selling gear that wasn't functioning well. The worse is some asshole who is "selling the item for a friend." Now I email every seller to see if they actually have seen the gear do what they claim it does, not what somebody told them it does. I've managed to get my money back, but lost on shipping in one case.

The good news is there are asshole buyers out there too. I've talked to sellers at local flea markets that have stopped selling on ebay since some ebay buyer would break the gear then demand a refund, or steal items out of the unit (say a module "option" on HP test gear), then say the unit is defective.

You can generally get better deals if you do them face to face.

The icom has PC control, but is not as good of a radio as the old
MVT7100. It is the MVT7100 that has no PC control.

When I am scanning an event like a military exercise, I put all the
frequencies in a scanner with PC control. As I find active frequencies,
I hand enter them into the MVT7100, and lock them out of the scanner
with PC control. I then end up with a record of the active frequencies
(in the MVT7100). Generally a not so good scanner will still pick up
the presence of a signal, so you can hunt with your lesser scanners and
listen with your better scanners.

Chasms maybe, but your posts in alt.support.hepatitis-c build a mighty fine bridge. Now everyone in this group can see you for what you are: a heroin shootin', MTV lovin', off-topic postin', hepatitis carryin' loser. My guess is that between your drug habit and your atrophied liver, you can't manage to do much other than post here. We'll just have to put up with it until that hepatitis C virus in your liver (which never, ever goes away and for which there is absolutely no cure) develops an attitude.

Just shoot up and you'll feel better. Chump.

Other sites have guides for beginners in the shortwave radio hobby. I
also decided to write my own:

http://tinyurl.com/my7wa

This is a basic guide for someone who has a radio and wants to know how
to find stations, test against a time station, improve reception, and
reduce interference.

Comments are welcome.

I smoked one little crumb of the good shit every night throughout my
treatment. Undetectable at 24 weeks and for 2 years since.

I told my doctor I was going to do this and she just rolled her eyes
and said nothing.

A positive attitude and GQOL are essential to succesful treatment.

1. A curious interpretation. Even the CKLW web page says,"the Role of the Canadian Radio and Television Comission (CRTC) in killing the station."
....1968 RKO/General sells the station to comply with CRTC ownership regulations
....1971 CRTC 30% Canadian content regulations hurt programming
The CKLW affair was a cause celebre at the time and has generated many websites. The quote was taken from <www.thebig8.net/>. CKLW coverage included Toledo and Cleveland as well as Windsor/Detroit.

2. Do the CFRB engineers pay the electric bill or rent? I am sure that this comes from the company and shows that total profit maximization is moderated by some sense of public service.

3. I notice that WHO, Des Moines Iowa, (50kw) (1040) is proud of its new webcasting service and likes to read reports from far-away places. Des Moines is not a noisy place and the few listeners in the city who might be helped would not justify the expense. There are hundreds of stations webcasting now. Are they all trying to fill in noisy spots in their primary area?

All three examples are of stations that are extending their coverage beyond their trading area. Why do they do this? Is the business changing?

I like insulated multistrand bell wire. You can pay fro fancier wire, but sooner or later, after a few years, the wire will get rusty and corroded and it will need to be replaced. Any hardware store or grange should have suitable wire. I'm not sure how long you want it to be, but make sure you have a static-lightening arrestor connected to it to protect your system <s>.

All life all holiness come from you O Lord

I paid $25 at Lowe's Home Improvement for a 500' roll of 12g solid
insulated -- course, that was a year or two ago. Might be $10-$15
higher now.

The specialized wire places have nice wire -- and I've bought my share
of it -- but basic copper is pretty cheap at the big-box stores.

Did the KGB help plan America's Foreign Intelligence Surveillance Act?

http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=21453

The remnants can be found in "Able Danger".

Saddam's WMDs: The Russian connection and the cover-up
http://www.renewamerica.us/columns/vernon/060220

The anti-wiretapping Left, from Benedict Arnold to Al Gore
http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=21421

Under Impeached Clintoon's Watch:
On the post-war weapons hunt, the arrogance and hubris of the [leftover
Clintoon era] intelligence community is such that they can't entertain the
possibility that they just failed to find the weapons because the Iraqis did
a good job cleaning up prior to their arrival.
http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=20154
http://www.brookesnews.com/052609cia_print.html
http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=20052

Iraqi WMD Mystery Solved
http://www.frontpagemag.com/Articles/ReadArticle.asp?ID=21489

REMEMBER "Able Danger"
http://www.worldnetdaily.com/news/article.asp?ARTICLE_ID=49019
...
"One reason that Bush, Cheney, and Rumsfeld made statements that
contradicted what they were told in CIA briefings might have been that they
were receiving information from another source that purported to have
evidence of Al Qaeda-Iraq ties. The information came from a covert
intelligence unit set up shortly after the September 11 attacks by
then-Undersecretary of Defense for Policy Douglas J. Feith."
...
"The secretive unit was set up because Cheney, Rumsfeld, Wolfowitz, and
Libby did not believe the CIA would be able to get to the bottom of the
matter of Iraq-Al Qaeda ties. The four men shared A LONG-STANDING DISTRUST
OF THE CIA FROM THEIR EALIER POSITIONS IN GOVERNMENT, and felt that the
agency had failed massively by not predicting the September 11 attacks."

[Remember - "Able Danger" & Impeached Clintoon]
...
"In January 2002, Maloof and Wurmser were succeeded at the intelligence unit by two Naval Reserve officers."
...
"Internal Pentagon records show not only that the small Pentagon unit had the ear of the highest officials in the government, but also that Rumsfeld and others considered the unit as a virtual alternative to intelligence analyses provided by the CIA."
...
"The Pentagon unit also routinely second-guessed the CIA's highly classified assessments. Regarding one report titled 'Iraq and al-Qaeda: Interpreting a Murky Relationship,' one of the Naval Reserve officers wrote: 'The report provides evidence from numerous intelligence sources over the course of a decade on interactions between Iraq and al-Qaida. In this regard, the report is excellent. Then in its interpretation of this information, CIA attempts to discredit, dismiss, or downgrade much of this reporting, resulting in inconsistent conclusions in many instances. Therefore, the CIA report should be read for content only-and CIA's interpretation ought to be ignored.'
[THIS LAST QUOTE IMPLIES THAT INTEL MAY HAVE BEEN SHARED WITH THE CIA!]
...
"The Plame affair was not so much a reflection of any personal animus toward Wilson or Plame... but rather the direct result of long-standing antipathy toward the CIA by Cheney, Libby, and others involved. They viewed Wilson's outspoken criticism of the Bush administration as an indirect attack by the spy agency."
...
http://nationaljournal.com/about/njweekly/stories/2005/1122nj1.htm

Ask yourself why, why why, and keep the words "Able Danger" in the back of your mind.

NOW READ THIS: http://www.brookesnews.com/052609cia_print.html

Then spend the weekend reading the book "Dragon In The Dark" by D.J. McGuire, and think about the Global Strategic importance of Middle East oil between Communist China and the U.S. - the Western Free world.

READ
http://china-e-lobby.blogspot.com/2005/09/on-war-on-terror-part-iii-communist_11.html

FYI: Saudi Arabian Royalty is now unstable. If it falls Saudi Arabia will be heavily courted by the Chinese Communists which already has deep ties with Iran and Syria, known terrorist States. Even Richard Clarke from the Impeached Clintoon administration recently said exactly that about Saudi Arabia's instability and China's intense interest on his book tour. In passing I might add.

"When all these facts are taken into consideration, all given their proper weight, then - unless you are either totally credulous or fanatical - you will have to admit that the resources of a certain country take on a

particular importance. What country might that be? Iraq."

http://www.truthout.org/cgi-bin/artman/exec/view.cgi/37/11131

It's all very simple really. To which Dear Leader do you wish to be captive? Saddam Insane? Communist Hu Jintao? Russian KGB Putin? Iran's IYaToldUso?

WHO?!

FACT: The fifth most common language in Blog-O-Sphere propaganda is Farsi [Iran].
Any wonder what these unemployed yet well educated Islamo-fascist Iranian bloggers are doing all day long? Translating anti-U.S., anti-Israel, conspiracy theories into English.

The Left-wing Neo-Kommie MoonBats are either deaf, dumb and blind, and are being manipulated by conspiracy theories originating from overseas propaganda blogs OR THEY ARE COMPLICIT OR BOTH. In the latter case they can simply be referred to as Useful Idiots or Virtual Islamo-fascist suicide bombers. STUPID USEFUL IDIOTS!

That's because I know the shortwave posting is the exception rather
than the rule. I wouldn't care if you made the occasional off-topic
post, but you post so much crap to this group that it's virtually
unreadable. That ain't right. You can get your 'viewpoint' across
without undermining the overall shortwave-related purpose of the group.

Thanks. I need all the holinesses I can gets.

That's why I use the tinned stuff for contact antennas. For pole and
insulator antennas I have this stuff from Home Depot called chandelier
wire, whic is about 20 g twisted copper. It turns green but doesn't
stretch or anything. That's what my 50 foot wire is. Between 2 egg
insulators driving a Palomar MLB.

I've also had excellent results with solid steel wire, which is $4 for
120 feet.

> Arbitrons showed a 5% drop in listenership in the evening?

Arbitron does not measure the skywave coverage area of the few AMs that get any extended skywave coverage. It measures market by market the Metropolitan Statistical Area or a similar definition adapted to the radio market. Any station from outside the market area that gets listening could show up in a distant market's Arbitron... but they don't. Out of home market Am listening in the US is almost always in a contiguous market... like Riverside listening to LA staitons or Flint listening to Detroit stations.

Radio listening at night is very low. Less than a third of the daytime listening levels, and more like a quarter for AM. So 5% of nothing is nothing. Advertisers seldom ask for spots after 7 PM, so most of what you hear is bonus or freebe spots.
>
> But that is what you are doing -- assuming that the 5% is
> statistically insignificant because you are looking at it in terms of
> listener density per geographical unit.

We are looking for listening in our home market. I am with a station that is #1 in LA, and is top 5 in Riverside. Riverside is a separate market, and we do not make a cent off it. So we do not care, do not promote in Riverside, do remotes in Riverside or pay attention to Riverside, even though we are a top 5 station out there. And this is with an FM... AMs care even less.
>
> ...and its not like those listeners are costing you extra, in terms of
> station expenses -- you aren't increasing power for the benefit of
> those 5% -- you would, however, be selling to them an ad that is not
> targeted to a geographic area.

Nobody cares. If an advertiser wants listeners in Shreeveport, there are 25 stations to pick from that actually have ratings there. Why pay Chicago rates to reach Shreeveport when the city has its own successful media?

> If that model was used on network television, there'd be no network TV
> ads, but there are. And somehow, network TV muddles on.

It is the same as cable. They are sold natinally based on reach and cost per national point. Radio is sold by the market, not by the country.
>

>> People are willing to do business cross country. And advertisers buy
>> national radio. But radio is SOLD according to local numbers.
>
> And that is where the model is flawed.

There is no model as AM stations do not get any significant listening outside their gvroundwave coverage area, and night radio is low listening level at best and not bought by most advertisers. Mainly, distant stations do not have listeners outside thier groundwave areas in significant quantities for an advertiser to justify paying to reach them.
>
> How many Hallicrafters radios would have been sold if they only
> advertised in Chicago newspapers?

Hallicrafters went broke. this is because long distance reception is not of interest any more, especially on AM medium wave.

CKLW was not specifically called on to uniquely change programming. CanCon
affected all stations alike, and ownership rule chages did as well. It was
just that CKLW was in a position to have benefitted extremely from the
pre-rule change situation.

Moswtly, CKLW dies as The Big 8 due to the death of AM as a music band.
>
> 2. Do the CFRB engineers pay the electric bill or rent? I am sure that

They have a site where the Am is located, no cost, the transmitter uses less
energy than the light in the parking lot, and it just goes on and on. At
some point, the people interested in keeping it running will tire and it
will be turned off.
>

> stations webcasting now. Are they all trying to fill in noisy spots in
> their primary area?

Yes. There is no revenue model for stations to get any revenue from anything
except locally reported listening. In fact, one of the reasons some stations
give is to also serve local residents who may be in a radio survey whyle
they are on a short trip or travelling out of the area. It is 100% about
local.
>
> All three examples are of stations that are extending their coverage

> changing?

No. webcasting is about giving a different local source for listening to
fill in for bad big building and shadow area reception.

In article <ivudnXLzntnpaY_ZnZ2dnUVZ_tGdnZ2d@comcast.com>,
James Douglas <james.douglas@genesis-software.com> wrote:

> As my existing fence is falling down and I have saved the 3K to replace
> it it's also time for a new antenna. What type of wire would be best?
> My existing antenna is around the fence about 8' in the area and the
> area is shaped like [with the long side running North/South.

Considering
1. Price
2. Conductor performance.
3. Insulation longevity

1. Discount warehouse home improvement hardware stores.

2. If you were to hang it up on insulators where the wire would have to support its own weight I would give a different answer but you indicate that the new fence will support it so best and cheapest would be solid copper and large diameter. The RF current at medium wave and short wave has a tendency to travel on the exterior of the wire so the resistance to RF current flow is much higher than it is for DC, which tends to use more of the wires cross-sectional area. This Rf effect is know as the skin effect so since the RF current only travels in the "skin" of the wire a larger diameter for a long stretch provides a helpful improvement in performance.

How big to go in diameter? Well bigger means larger circumference. According to this web page calculator 15 MHz has a rounded skin depth of 0.000662 inch. That's a pretty thin layer so a step in wire size must mean a significant drop in RF resistance per foot. I would go with the largest wire size available for a reasonable price. Something in the #6, 8 or 10 size would be a good bet.

3. Must withstand the sun and weather effects. Teflon coated is the same color of the fence would be a good choice.

Webster's:

junkie
One entry found for junkie.

Main Entry: junkï¿½ie
Variant(s): also junky /'j&[ng]-kE/
Function: noun
Inflected Form(s): plural junkï¿½ies
1 slang a : a narcotics peddler or addict b : a person who derives
inordinate pleasure from or who is dependent on something <sugar
junkie> <television news junkie>
2 : a junk dealer

Now I have to look up ''pedantic''.

I'm sure that if you cared to track it, you would find that you made
quite a bit of money there. But you don't because your model tells
you that the world ends at the edge of LA. It doesn't, though, and a
smart advertiser would take advantage of that even if you are
stubbornly unwilling to accept that radio waves go beyond LA and that
people beyond LA -- in your own words,

> even though we are a
> top 5 station out there

they just might spend money on products you advertise.

> > How many Hallicrafters radios would have been sold if they only
> > advertised in Chicago newspapers?
>
> Hallicrafters went broke. this is because long distance reception is not of
> interest any more, especially on AM medium wave.

Hallicrafters went broke because Japan out-thought and outsold the
U.S. in the 70s when it came to shortwave markets. Perhaps you'll
tell me that ICOM, Sony, Kenwood, Yaesu, Degen, et. al. all don't
exist now?

However, that's beside the point. The point is that if Halli only
sold locally in Chicago, neither you nor I would have ever heard of
them.

...for that matter, had Japan's electronics companies not targeted the
U.S., we would never have heard of them, nor would they have become
the giants they are today. THEY certainly saw that the world didn't
end beyond their shores. (And Japanese culture is almost synonymous
with insular.)

Your view of your listening community will do more to destroy american
radio than anything else. You and Peter can insist that "that's the
way it is," but the truth is "that's the way your model sees it."
Fine. Ignore your real customers. Insult them even and tell them
they don't exist. It's *your* career path, not mine. Enjoy the ride
all the way into the ground.

???

If ''skin effect'' is a consideration you want stranded, not solid.

But for receiving it's not a factor.

The same is happening here out on the West Coast in Huntington Beach. I find that daily the 21 mHz is totaly dead! The 17 mHz band is about half dead with only USA and New Zealand stations coming in okay. From 15 mHz downwards, stations from the Pacific Rim and Africa are coming in all okay. Something Is Up!!!

I am hoping that this does not happen to the Degen 1108 (upcoming table radio, end of 2006). I bought my Degen 1102 for $47 and I know the Kaito version is sold for $99 in the US.

The 1108 is going to be a $400 or $500 radio if sold by Kaito - I'll buy the $200 - $300 version thank you very much!

(Stats on the 1108 can be found at http://www.radiointel.com on the left side of the title page)

Black clandestines were Henry Kissinger's idea. I doubt that anybody in the Bush Regime is that creative. They'll probably unveil a "competitor" to the BBC whose propaganda will be so obvious that everybody will know to avoid it-and nobody will listen to it. Look at Radio Sawa, or Al Houri TV channel. Or they'll pass a law saying that the VOA can broadcast to domestic audiences, and we'll get News Now all day. Or they'll use a jammer of continuous rap music.

>
> I'm sure that if you cared to track it, you would find that you made
> quite a bit of money there. But you don't because your model tells
> you that the world ends at the edge of LA.

We make no money and never have. The Inland Empire is bought as a separate market. As such, advertisers buy in-market stations at a tiny fraction (about 10% to 15%) of LA rates to target the IE specifically. They do not buy LA stations to cover the IE as nearly all have imperfect coverage of the area, and do not offer support, like remotes, promotions and other in-market marketing.

The ad world does end at the edges of the LA MSA, whch consists of LA and Orange Counties. You get a nice, "yes, sure2 when you point out that they are getting the IE for "free" with the buy, but advertisers till want promotions and presence int he LA market and will not pay extra for IE coverage.

By the way, we have had at least 2 staitons in the top 3 25-54 (the sales demo) in LA for the last 11 years, and currently have three of the top 5. We get no money from fringe markets, never have, never will.

> It doesn't, though, and a
> smart advertiser would take advantage of that even if you are
> stubbornly unwilling to accept that radio waves go beyond LA and that
> people beyond LA -- in your own words,

Advertisers buy "by the market" and the IE is a separate market from LA. There are no "smart advertisers" as the customers know that out of market stations, even with ratings, are seldom as effective as in market stations that offer value added in the market. And an LA station is not going to go into the Inland Empire to sell at $120 a spot when they sell at $2,000 in LA.
>
>> even though we are a
>> top 5 station out there
>

> they just might spend money on products you advertise.

I don't advertise any products. We run ads for other people with products. None of whom care an iota abut out of metro coverage as it comes with no promotional and in-market support.

>> Hallicrafters went broke. this is because long distance reception is not
>> of

> U.S. in the 70s when it came to shortwave markets. Perhaps you'll
> tell me that ICOM, Sony, Kenwood, Yaesu, Degen, et. al. all don't
> exist now?

Drake abandoned general coverage receivers, and there has been an on-again, off agian chatter about ICOM leaving the GC sector.

In any case, we are discussing distant MW reception, and the main reason the Hallicrafters and Hammarlunds and Drakes and Galaxys of the US left the market is that there is low demand... partly because there is limited interest in distant MW reception compared with the 50's and 60's.

> Your view of your listening community will do more to destroy american
> radio than anything else. You and Peter can insist that "that's the
> way it is," but the truth is "that's the way your model sees it."

The biggest fact you are ignoring, among many, is that radio listening in daytime is on average about 22% of all people at any given time. In evenings, after 7 PM, it drops by 11 PM to about 2%. Advertisers specifically exclude nights and overnights from ad buys. So out of market coverage is irrelevant. Most Ams do not have any our of market coverage, as they are daytimers or directional or lower powered and on congested channels.

The few AMs that do have fairly borad night signals do not get listening in enough quantity out of market to make anything of. Advertisers do not buy at night, and stations generally have no ratings outside of the groundwave area. Add to that the fact that most of the former 1 A stations are very localized, with lots of city-specific traffic reports and local news and local events that they are of no interest 500 miles away. They win big in the metro by being local and relevant. There is no money for out of metro advertising and such big stations are not going to sacrifice local for a couple of C.C. Crane PI spots.

> Fine. Ignore your real customers. Insult them even and tell them
> they don't exist. It's *your* career path, not mine. Enjoy the ride
> all the way into the ground.

My ride is just fine, based on localism. Having 3 of the top 5 in the largest ad market in America is hardly riding into the ground. And we are doing fine in our other 16 markets, too, with the same model. And we have a number of 50 kw AMs. They serve the local community, well, and only.

>

I ended up getting 500' of #14 stranded copper, with 15mils insulation
for $28.00, they wanted $32.00 for 200' taken from the large spool? WTF?

Now I may extend the antenna to include a piece that runs across the top
of the roof, which on my house is about 30' up in the air! Would that be
good or bad, again I have 150' around the fence that runs in the shape
of a C, what if I added a "extender" across the roof vent and ran a wire
down the to main antenna? I have heard that "higher is better"

I am also thinking about adding a two foot extension to the fence posts
so that I can get the antenna up a little higher but am wondering what
the neighbors are going to think?

I do have a balun from Erickson Enginering, which seems to help so far
although conditions have not been favorable here lately, and also have
8' copper rod pounded into the ground.

Doubling back in the same plane is probably counterproductive. I'd
get as big an ''L'' shaped configuration as I could. I'd also keep
the antenna away from the house as it probably has lots of noise
sources. Use the ''BalUn'' to match the wire to some co-ax to get the
signal into your house from a safe distance away.
http://www.hard-core-dx.com/nordicdx/antenna/feed/balun3.html

The higher the better. (That's for Steve!)

Yeah? So how d'ya find the SW07? How would you say it compares to the SW100? I like the compact size of the SW07, but it's a rare occasion that I find its performance appreciably better than that of the SW7600G or GR.

I'm sure that your advertisers, if they measure where their customers
come from, would find that the world doesn't end at LA.

> By the way, we have had at least 2 staitons in the top 3 25-54 (the sales
> demo) in LA for the last 11 years, and currently have three of the top 5.
> We get no money from fringe markets, never have, never will.

Sure, if you don't sell to advertisers who ignore their customer base
outside of LA. All those ignorant yokels out in the boonies, though,
they might want to buy things too, and if those ignorant yokels happen
to have quite a bit of money, they might want the finer things that LA
can offer but the local stores don't.

I guarantee you that within a 10 mile radius of where I live, the
median and mean incomes are far, FAR above the Denver metro area,
where advertisers following your model will target.

For that matter, I guarantee you that if you swept a ring 10 miles
wide with its inner edge 50 miles outside of Denver around denver,
that median and mean income collection would also be higher than the
Metro area.

> In any case, we are discussing distant MW reception, and the main reason the

Disagree. I think in fact your view is utterly inaccurate. The
market for inexpensive MW reception will go on until you kill it, and
you appear to be working very hard at it.

>
> > Your view of your listening community will do more to destroy american

After 11 PM, yes, to 2%. What's your 7-9 PM numbers?

Yet you still manage to sell ads at night. I've never heard a station
that went consistently commercial-free from 11 PM to 6 AM.

>
> The few AMs that do have fairly borad night signals do not get listening in
> enough quantity out of market to make anything of.

Again, if you don't sell to advertisers who can 1) utilize that market
and 2) measure it, I think you'd find differently.

But, you'll never know if Arbitron throws away any numbers that don't
fit the market. Hell, even the local NPR outlet knows better, based
in Greeley, CO and pitching themselves from Wyoming to Denver. I
wonder what their pledge numbers look like -- they certainly don't
throw away pledges from outside of their coverage area. (As an
aside, I wonder what Arbitron does with their numbers?)

>Advertisers do not buy at
> night,

None? Never? I'll just ignore the ads I hear at night, then.

> and stations generally have no ratings outside of the groundwave
> area.

Hmmm. I'll have to go read up on the Minn. Twins debacle to see about
that. It was covered in this thread... someone went by the numbers
(and the dollars they believed they had) and killed off their market.

> > Fine. Ignore your real customers. Insult them even and tell them
> > they don't exist. It's *your* career path, not mine. Enjoy the ride

>
> My ride is just fine, based on localism. Having 3 of the top 5 in the
> largest ad market in America is hardly riding into the ground. And we are
> doing fine in our other 16 markets, too, with the same model. And we have a

> number of 50 kw AMs. They serve the local community, well, and only.

There are really only a couple reasons to listen to AM radio today.
1) low cost of receivers. 2) long-range reception for whatever
reason that listener may have. 3) talk radio -- AM is never going to
challenge FM on fidelity, IBOC or not. I wonder how many classical
and jazz AMs there are out there? That's an answer I'd trust you to
have.

But I think your ride is going into the ground. In fact, this thread
has depressed me into thinking that XM and/or Sirius may just succeed,
because they aren't foolish enough to accept an arbitrary boundary on
their footprint. (okay, national boundaries, but things get really
complicated on that one.) Their coverage area is the continental U.S.
and they'll go ahead and sell their ads to anyone willing to put them
on the air. (Commercial free? ha. I doubt one channel of the
satellite services will be commercial free in 10 years.)

It would be very, very interesting to see the raw, unmassaged data
that Arbitron (and the other one) collect and see what happens when
they start putting together demographics and quantity (but NOT
geography) of all the out-of-market listeners. Obviously that's
closely held, but probably someone like you or Peter could have seen
it in some job somewhere along the line.

You might run the extension, and clip it to your regular fence antenna
with an alligator clip -- have someone attach and unattach it out in
the yard while you listen to signals. That way, you can see if it
improves reception or not.

What I presume is the aforementioned station, on 4.755 at 0057 utc, putting in a good ten over here in Wilmington, NC. I haven't as of yet heard an ID, though according to EiBi, I see no other station broadcasting at that time or frequency. Is this a pretty average catch? Just curious, as I've no recollection of coming across this one before.

Most advertisers we have advertise on a plethora of media, so they can not
tell which specific entity in which specific medium does what. Further, they
don't care as they have metrics for evaluating the reach of a campaign.
>
>> By the way, we have had at least 2 staitons in the top 3 25-54 (the sales

>
> Sure, if you don't sell to advertisers who ignore their customer base
> outside of LA.

The fact that you are being obstinate shows you are unfamiliar with how
media sales are conducted. If you knew, you would know that the medium
(radi) and the station have no influence on buying patterns at all but the
smallest advertisers. And those small advertisers can not afford a top LA
station.

Again, if a regional or naitonal account wants to buy a market outside LA, they buy the stations that are home to the local market, as the "from affar" stations can not not do the merchandising, promotion, remotes and things that are part of many if not most radio buys.

> All those ignorant yokels out in the boonies, though,
> they might want to buy things too, and if those ignorant yokels happen
> to have quite a bit of money, they might want the finer things that LA
> can offer but the local stores don't.

But ad buyers reach them through local media. Since it takes hours to drive from central Riverside county to central LA County, and anyting available in one is available in the other, it is unlikely anyone drives 120 miles to shop in LA... or in Riverside.
>
> I guarantee you that within a 10 mile radius of where I live, the

> where advertisers following your model will target.

The Denver radio market is made up of 7 counties. I am pretty sure your area is inside it. The only other separately bought markets nearby are Puebo, Colorado Springs and Ft. Collins - Greeley. Each is a separate marekt area.
>
> For that matter, I guarantee you that if you swept a ring 10 miles
> wide with its inner edge 50 miles outside of Denver around denver,

> Metro area.

I ran this in Mapquest and the more rural you get, the more incomes goe down.

In any case, that data is irrelevant. Radio advertising, whether local, regional or national, is bought by market and the people who design campaigns know all this stuff. what they also realize is that the best way to reach listeners is on local stations as they have the ability to provide added value locally.
>
>> In any case, we are discussing distant MW reception, and the main reason

> you appear to be working very hard at it.

The market in discussion is DX skywave reception of MW, which is so small as to be unmeasurable by Arbitron. Since skywave only occurs at night, and raido listening is very light at night and seldom bought by advertisers, there is a decline in interest in programming to this daypart by staitons and near zero interest by clients. If big numbers of listeners (relatively speaking) int he metros are not bought at night, tiny numbers in Numb Pluck,

AR, are of no interest except to PI accounts... and many stations do not take PI.

In any case, the stations with decent night coverage do so well in thier local metros they do not care about distant listeners.

Local AM is very alive on staitons that have the few good-enough signals that cover the entire metro. In fact, one of ours, a 50 kw station in Miami, is typically in the top 5 in that market and has been for over a decade. This is because it gives local service to the Miami community it targets and does not worry about Key West or Palm Beach or Naples or Yeehaw Junction, all of which it covers (but gets no listeners in).

>
> After 11 PM, yes, to 2%. What's your 7-9 PM numbers?

Radio listening declines from about 11% in 7 PM to 8 to 2% from 11 to Midnight. And since these are the hours advertisers mostly buy on TV, they do NOT buy radio in the same daypart.
>
> Yet you still manage to sell ads at night. I've never heard a station
> that went consistently commercial-free from 11 PM to 6 AM.

Most of what you hear are bonus spots, rotators and ROS buys. There are sledom any night-specific buys. Sometimes a station that is enormously strong in mornings can force advertisers to buy 1 AM to Midnight to be "allowed" to get on 6 to 10 AM, but nights are pretty much a wash.
>
>>
>> The few AMs that do have fairly borad night signals do not get listening
>> in
>> enough quantity out of market to make anything of.
>
> Again, if you don't sell to advertisers who can 1) utilize that market
> and 2) measure it, I think you'd find differently.

There are no such advertisers. Any advertiser that buys multiple markets has an agency, and they buy by market and do not have the time to worry about 11 skywave listeners 500 miles away.

The LA staiton I referred to has over 1.2 million weekly listeners in the LA market. Nothing it could get in fringe markets would enghance significantly the reach, and advertisers buying LA would not stand for rates based on out of market coverage, not to mention that this would blow the equal-geography

standard for metrics they use.
>
> But, you'll never know if Arbitron throws away any numbers that don't
> fit the market.

Arbitron does not throw away anything. If an out of market station gets the minimum amount of reporting to make the book, they are in it. Same as a local station. No different standards. What happens is that, except for peripheral markets, staitons do not make the book based on a) night listening alone and b) skywave.

> Hell, even the local NPR outlet knows better, based
> in Greeley, CO and pitching themselves from Wyoming to Denver. I
> wonder what their pledge numbers look like -- they certainly don't
> throw away pledges from outside of their coverage area. (As an
> aside, I wonder what Arbitron does with their numbers?)

Pledges do not come through ad agencies and client marketing departments. NPR can beg wherever they want. Commercial radio has to adjust to the reality of how advertisers want to buy us.
>
>>Advertisers do not buy at
>> night,
>
> None? Never? I'll just ignore the ads I hear at night, then.

Freebies, PI, bonus spots, forced ROS buys, rotators. Nights and overnights hardly contriute to station revenue.
>
>> and stations generally have no ratings outside of the groundwave
>> area.
>
> Hmmm. I'll have to go read up on the Minn. Twins debacle to see about

> (and the dollars they believed they had) and killed off their market.

That makes no sense. Again... AMs do not get ratings outside the groundwave coverage area, so they do not sell outside that area. In fact, most metro area AMs only get ratings inside the 10 mv/m contour (due to nooise levels in modern cities) so all tha tcounts is the primar daytime groundwave signal.
>

And the successful staitons today on AM are local, do talk or news or sports if they are in the first tier. The other group of enormously successful AMs do religion, gospel, and much ethnic programming. The Farsi staiton in LA is enormously profitable, as are several Korean, Chinese and Vietnamese langauge staitons.

Since most markets only have a few full coverage AMs that blanket the market, just a couple of talkers and a sports station usually fills up the good facilities.
>
> But I think your ride is going into the ground. In fact, this thread

Most satellite channels have no ads, and ads wil be at best a couple of percent of revenues. Satellite sells a service to the listener. radio sells advertising to advertisers. We do what advertisers want, not what you think is a good model in another business. Sorry, wrong argument.
>
> It would be very, very interesting to see the raw, unmassaged data
> that Arbitron (and the other one)

There is no "other" one.

> collect and see what happens when
> they start putting together demographics and quantity (but NOT
> geography) of all the out-of-market listeners.

Any subscriber has this data on thier desktop. I looked at 17 markets, from NY to Mc Allen and can not find any skywave listening being recorded. There are a lot of below the minimum mentions, but to stations on the fringes of the markets or to very poor performing locals. But no AM night skywave.

FYI, Arbitron is audited every year by a committe of experts called the MRC which reporesents advertisers and agencies. The methodology treats all staitons equally... if Radio Moscow appeared in a minimum number of diaries, it would be ranked int he ratings along with all the other qualifying stations.

> Obviously that's
> closely held, but probably someone like you or Peter could have seen

> it in some job somewhere along the line.

Every subscriber can see every station that had atleast one diary mention in every book. There is nothing closely held about this data. It just does not contain anything that contributes to your argument... quite the contrary, it blows it out of the water.

Yes higher is better but you will want to keep the antenna away from
your electrically noisy house so I advise against this.

> I am also thinking about adding a two foot extension to the fence posts

This will not be worth the trouble. You would need to move it more like
10 feet to make a difference.

>They work well in a low local noise location.

As will nearly anything.

>A random or long wire could be a good reference antenna against a new
>design.

To me, a random wire would be a poor reference antenna. To me, there
are basically two reference antennas. The horizontal dipole, which
would
be the reference for horizontal antennas, and the 1/4 monopole, which
would be a reference to compare against vertical antennas.
For elevated verticals, I use the 1/4 wave ground plane as the
reference
antenna.
A random wire is much too random. The antennas I use as benchmarks
all have well known and repeatable performance. All my horizontal wire
antennas are compared to the 1/2 wave dipole. BTW, not many win either,
unless they are gain antennas. As far as efficiency on a certain band,
it's
hard to beat a coax fed dipole. And thusly, it's my usual "benchmark"
antenna.

I would be in the Ft. Collins - Greeley market. However, there are
far more listeners to Denver stations in Ft. Collins than there are
Ft. Collins listeners -- at least in my experience.

I'm in Larimer County, BTW.

In the area described above, I wouldn't be surprised if the median
income is 80k (or higher).

> down.

Mapquest tells incomes of the area being plotted?

I would believe that in the eastern counties -- Adams, for example --
the income goes down. But coverage of The NW side -- Boulder, Grand,
Broomfield, etc. it will be very high. I think Castle Rock is
probably a wash. SW side is high-priced again.

...and we all know from personal experience that marketing always
reflects reality, right?

It's still a helluva way to run a railroad, no matter what you say
about it.

I used plastic coated clothesline wire for years. It's stranded steel
and is super strong. The ends were over a hundred feet apart and it was
stretched pretty tight. Never any sagging due to ice. A split bolt on
each end held it around the insulators.

The cast from Alfred Hitchcock's 'The Birds' never showed, so I can't
comment on hundreds of birds perching on it.

Hi all,

The Car and Deep Cycle Battery FAQ has been updated. The current version is 5.4, dated February 26, 2006 and can be found on www.batteryfaq.org. Answers to Frequently Asked Questions, tips, manufacturer's information, references and hyperlinks are contained on this free, consumer oriented Web site about car, motorcycle, power sports, truck, boat, marine, recreational vehicle, solar, and other starting and deep cycle applications.

The most popular sections in February were:

Battery Manufacturers and Brand Names List

FAQ Section 9 HOW DO I CHARGE (OR EQUALIZE) MY BATTERY?

Section 7 WHAT DO I LOOK FOR IN BUYING A NEW BATTERY?

Battery Information Links List

Section 4 HOW DO I TEST A BATTERY?

If you have time, please visit www.batteryfaq.org. If not please bookmark it for future reference. Quesions, comments and suggestions for improvement are always welcome at info@batteryfaq.org.

Many thanks and kindest regards,

BiLL.....

You are not making logical sense. The random wire non-resonant common
mode antenna is a good reference antenna precisely because it has little
theoretical gain and it will work anywhere. You compare it against a
dipole and the dipole should show gain over it as should any other
antenna type made to be resonant at some frequency. Stop thinking like
an amateur, this is a SW listening news group. A random wire is the
basic antenna here. If you want technical antenna theory then yeah a
dipole is a basic reference radiator most transmit antennas.

But try to understasnd, whether that is true or not, advertisers buy each
market separately.
>

Very few ad campaigns are income based, as most are for mass market products
and services. Specific high income ZIPs or areas having other
characteristics are usually targeted by direct mail or other more thightly
focused medium.
>
> Mapquest tells incomes of the area being plotted?

The Arbitron application based on it goes right down to listening habits and
income and family size, ttc.
>

Boulder, etc., are in the Denver MSA. And radio is NOT bought on the ZIP
code level. It is mass media, and used for reach and frequency, not the sort
of thing that direct mail, etc. do better.

Yeah, it usually does. The companies that advertise usually know a lot more about the user of the product and its marketing goals than a radios station does. In fact, the product was probably developed today by a company tha tis in marketing mode as opposed to the older production mode model. As such, the rpduct was designed with user input, and then marketed to the greatest potential users.
>
> It's still a helluva way to run a railroad, no matter what you say

Your misunderstanding of the way radio is listened to is monumental, and the basis for your failure to get the way advertising is bought. Radio is mostly listened to in the daytime. It is nearly 100% listened to in the very strongest signal contours of FM and AM stations. Advertisers only use local stations to reach local audiences, as they depend on more than on air advertising as part of an ad buy, and out of town stations do not do merchandising, promotion or remotes or shows or club appearances or taste testings or mystery shopper promotions or whatever outside their own market where 99.999999999999% of their listeners are anyway.

I have heard that a big portion of the AMBCB advertising market is rush
hour traffic times in the local market. True?

6 Am to 7 PM is where nearly all the ad buys are placed.

Listening levels are pretty similar throughout those 13 hours. Only 30% of
radio listening is in cars, while the bulk is at work and in home.

1766. The Next Step - The Low Noise Inverted "L" {Random Wire} Antenna - Question Shortwave Listening (SWL) Antenna Tuners - Do You Have An Opinion ?

Newsgroup: rec.radio.shortwave
Date: 2006-03-12 07:12:08 UTC
From: RHF <rhf-newsgroups@pacbell.net>

Source record: 67156

For One and All,

THE PROFESSIONAL {AMATEUR} VIEW POINT
- - - HAMMING IT UP ! - - -
The 1/2 Wave Length Dipole and the 1/4 Wave Length Vertical are both good Technical {Reference} Antennas for the "Specific Frequency" related to their Measured Wave Lengths. For Amateur {Ham} Radio use where you are Operating in a Certain Amateur Band and on a Single Selected Frequency; they are excellent Receive and Transmit Antennas.

SHORWAVE LISTENING (SWL) - HEY IT'S JUST A HOBBY
[KEEPING IT SIMPLE AND PRACTICAL] {KISAP}
The Random Wire Antenna that is generally good on All Frequencies across the Shortwave Bands from 1.8 MHz to 30 MHz is the most commonly used Antenna for Shortwave Listening (SWL) and thus is the Practical {Reference} Antenna for the Shortwave Listener (SWL). It is simply A-Common-Point-of-Reference for All Shortwave Listeners (SWLs) to 'compare' the relative perfromance of their respective Shortwave Listening (SWL) Antennas. The Random Wire Antenna, while not very good on any Specific Frequency is simply so-so-good across All Shortwave Frequencies. To some extent the qualities that make an 'un-tuned' Random Wire a poor Amateur Antenna; are the same qualities that make it a very good Shortwave Listening (SWL) Antenna. The modern solid-state General Coverage 1.8 MHz to 30 MHz Shortwave Receiver has enough Gain and sufficient Dynamic Range to make full use of the Signal Levels that can be producted by a Random Wire Antenna that is 35 Feet to 105 Feet long. For most Shortwave Listeners (SWLs) what more do they need other than Lower Noise and Better Signal Quality relative to Noise. {Improved Signal-to-Noise S/N Ratio}.
The-Bottom-Line : The Random Wire Antenna is :
+ Simple
+ Practical
+ More Than "Good Enough"
For the vast majority of the Shortwave Listener's (SWLs) Shortwave Radio Listening Needs [.]

THE NEXT STEP - LOW NOISE INVERTED "L" {RANDOM WIRE} ANTENNA
Starting with the Random Wire Antenna and incorporating a few improvements can result in an Shortwave Listening (SWL) Antenna that has for it's size and placement a better Signal-to-Noise S/N Ratio then a plain Random Wire {so-called Longwire} Antenna

THREE-TO-READ BY JOHN DOTY :
* The Inverted "L" Antenna 'Shape' lends itself to the Design

Concepts of a "Low Noise Antenna" that has been popularized
by John Doty; consisting of: Antenna Element; Matching Transformer;
Grounding Point; Coax Cable Feed-in-Line; and Radio/Receiver.

1768. Battlestar Galactica

Newsgroup: rec.radio.shortwave
Date: 2006-03-12 07:27:49 UTC
From: latitude61 <dev@null.com>
Message-ID: <1217jbmi5ah0j6b@corp.supernews.com>

I couldn't help but notice that a few scenes in Friday night's thrilling episode of Battlestar Galactica on Scifi had a Grundig FR200 (or equivalent) used as a prop. Talk about keeping the budget under control.

1769. Something Different - On-the-Fence Loop Antenna for the Shortwave Listener (SWL)

Newsgroup: rec.radio.shortwave
Date: 2006-03-12 07:59:25 UTC
From: RHF <rhf-newsgroups@pacbell.net>
Message-ID: <1142150365.579577.204560@u72g2000cwu.googlegroups.com>
Source record: 67158

JD,

Something Different - - -
On-the-Fence Loop Antenna for the Shortwave Listener (SWL)

You should first install an 8-Ft Ground Rod at the
Foot (Base) of the new Fence.
Note - This will be the Starting and Ending Point for
your Wire Antenna Element
+ The Mounting Place for your Matching Transformer
{ A Balun = Loop-to-Coax }
+ The Connecting Point for your Coax Cable.

Start by running the Wire Antenna Element out along
the Bottom of the Fence to your Far-Point.

Then a short Wire Antenna Element Leg-Up to the
Top of the Fence.

Next run the Wire Antenna Element back along
the Top of the Fence to your Starting-Point.

Finally a a short Wire Antenna Element Down-Leg
to the Bottom of the Fence.

Mount your Matching Transformer to the Ground Rod

Connect your Coax Cable to the Matching Transformer.

Connect your Two Wire Antenna Element Ends
to the Matching Transformer.

You now have an On-the-Fence Loop Antenna
[Bent-Around-the-Fence]

FWIW - Two On-the-Fence Loop Antennas
One Rigged on the Fence along one Side of the Yard
One Rigged on the Fence along the Back of the Yard
Set at 90 Degress and being about 8-ft apart at their
Starting Points from a common Corner can give you
more Receiving Antenna Options.
Note - Separate Ground Rods, Baluns and Coax Cable
Feed-in-Lines are recommended if you choose to use
two On-the-Fence Loop Antennas.

As to the Question of Antenna Wire Size :
14 AWG Insulated Copper Wire with 19-Strands

and using PVC Insulation is cost effective and durable.
HomeDepot type - THWN or THHN in 500 Foot Spools

TIP - One of the most important details of an On-the-Fence
Antenna is the Stand-Offs used to keep the Wire "OFF"
the Fence and in the Air. TV "Stand-Offs" with Plastic
Insulator Head and 3.5" Wood Screw base hardware.

Do *you* believe that, Telamon? You're an SWL, so your personal
habits are different. But of your neighbors, do they have the radio
on more or the TV on more? Or even their iPod (or equivalent)?
People who listen to the radio at home are usually sports fans
catching their hometown station.

On the other hand, in the car, you have your own recordings and radio
as viable choices, unless you like the idea of driving off into a
ditch.

bingo! We have a winner!

(or in your case, a *loser.*)

Therein lies the problem with your -- radio marketing types -- model
of the listener and reality.

> Specific high income ZIPs

...that doesn't fit reality, either. Look up my ZIP -- 80537 -- and I
bet you see working class/lower middle class as how it is portrayed.
However, along with being the west side of the city of Loveland, it is
also quite a large area of unincorporated Larimer county, filled with
ranchettes, little mountain communities with generally very high
income with modest to large homes on acerage (that would be me), and
mini-mansions on acreage (that would be my neighbor).

> or areas having other
> characteristics are usually targeted by direct mail or other more thightly
> focused medium.

...and therein lies the problem. You aren't looking for listeners who
buy -- you are looking for listeners who are densely packed. It ain't
called "target-casting," it's "broadcasting."

>
> Boulder, etc., are in the Denver MSA.

Now go to the FCC site and pull a coverage map for Denver based
stations. Boulder is in a valley -- a signal hole, invisible to
Lookout Mountain, where many Denver broadcasters live. They can't
cover Boulder for crap. They can and do, however, cover all the way
down to New Mexico.

> > ...and we all know from personal experience that marketing always
> > reflects reality, right?
>
> Yeah, it usually does.

Which is why New Coke did so well, the Ford Edsel was a rip-roaring
success, the Chevy Miata is hailed as a great move by GM and Robert

Macnamara will go down in history as the greatest market researcher
ever.

Oh, and no one reads the comic strip Dilbert, because its descriptions
of corporate life are pure fantasy.

> The companies that advertise usually know a lot more
> about the user of the product and its marketing goals than a radios station
> does.

Given what you seem to assume about your target audiences, I have
absolutely no trouble believing that for a second.

Good thing, too, because I bet that a seller -- that is, a buyer of
advertising time -- on WLW knows how many units they move in East
Overshoe, that place that doesn't exist in your world.

> In fact, the product was probably developed today by a company tha tis
> in marketing mode as opposed to the older production mode model. As such,
> the rpduct was designed with user input, and then marketed to the greatest
> potential users.

That's true. But it doesn't affect how radio people intentionally
misunderstand their audience.

> >
> > It's still a helluva way to run a railroad, no matter what you say
> > about it.
>
> Your misunderstanding of the way radio is listened to is monumental,

Um, no.

I listen. Do you? Do you even know listeners, or do you only know
the arbitron numbers, those that only reflect listeners "above a
certain threshold" per ZIP code?

Your methodology reminds me of an old joke about a physicist studying
prime numbers: "1 doesn't count... 2 is prime, 3 is prime, 4 is...
NOT prime, 5 is prime. 4 must be experimental error, therefore all
integers are prime."

Your results remind me once again how detached marketing is from
reality. Some years back, I got contacted by a telephone marketing
survey, wanting to study people's opinions of US-West, now Qwest, the
most wretched phone company I've ever had to deal with. Because they
wanted hard, measurable data, they asked a series of yes-no questions
about quest. Not a single question was asked about the quality or
reliability of their service. Not one. After about 5 minutes of
yes-no questions on total irrelevency, "In your opinion, have the
operators at US-west been polite and friendly?" I said, nicely but in
exasperation, "You haven't asked the right question yet." They never
did.

And neither do you.

> and the
> basis for your failure to get the way advertising is bought.

I get it. I get it just fine. Just like I "get" The Flat Earth
Society.

> Radio is mostly
> listened to in the daytime.

Sure -- drive time. What your next biggest listening period outside
of rush hour?

> It is nearly 100% listened to in the very
> strongest signal contours of FM and AM stations.

By your massaged, filtered numbers, yes. But you are filtering a
large number of people out of your survey. They, to you, are down in
the noise, in the insignificant digits range. But that "noise," added
up, makes a significant bloc of people.

> Advertisers only use local
> stations to reach local audiences,

Either because you won't sell them the time, or they are a local
product (like a bar or a pizza joint), or, gawd help us all, they
believe people like you.

> as they depend on more than on air
> advertising as part of an ad buy, and out of town stations do not do
> merchandising, promotion or remotes or shows or club appearances or taste
> testings or mystery shopper promotions or whatever outside their own market
> where 99.999999999999% of their listeners are anyway.

...all of the above are irrelevent and gimmicery. I personally have
never gone to see a remote. I certainly wouldn't, say, go buy a car
based on a remote. But then, I consider myself to be above average
intelligence -- maybe the below-average Joe or Jane *will* buy a car
because KSUX is doing a remote at the local chevy outlet.

Oh, and, "99.999999999999%"? Are you sure? You referred to

> The LA staiton I referred to has over 1.2 million weekly listeners

...so a single listener not recorded by your beloved Arbitrons would
be far more than the 0.000000000001% needed to break your percentage.

But you know that. Your station is a top 5 in a market it refuses to
sell to. Because they don't exist, according to your beloved numbers.

Once again, because I need to spell these things out for you, I'm not
suggesting you sell bar X outside of your home market. But if you can
place ads for companies that do mail order work, or are a chain, or
otherwise aren't tied to a geographic element, why not do so?
"Because we don't work that way," is a piss-poor answer.

I reiterate: Thinking inside your tiny little box will probably doom traditional broadcast-band radio.

Don't feel too bad, though, you have company: Clear Channel thinks that selling the most bland mush will keep radio going because it fits into their market surveys of what people want.

>You are not making logical sense. The random wire non-resonant common
>mode antenna is a good reference antenna precisely because it has little
>theoretical gain and it will work anywhere.

So the same can be said for a 1/2 wave dipole. The gain of a length
of wire will not vary much depending on how it's fed. Only the length
really matters. Of course, different methods of feeding vary as far as
system efficiency. In the case of 1/2 wave or smaller wires, the
efficiency of the feed system is about the only thing that matters
much among the various versions of such.

> You compare it against a
>dipole and the dipole should show gain over it as should any other
>antenna type made to be resonant at some frequency.

How you fiqure? If the random wire were longer than the 1/2 WL dipole,
it could actually have more gain in a certain direction. The reason a
dipole is the common benchmark for horizontal wires is because it's a
well known measured quanity. Exactly what you want as a "benchmark",
or reference antenna. Look at most any antenna ad's for yagi's. If you
can find one that is measured against a random wire, I'll send you $20.
Most all will be measured against a 1/2 wave dipole at the same height,

or instead be listed as dbi, which is a theoretical value. The only
difference
between dbd and dbi is about 2.1 db. You are just shifting your
reference.

> Stop thinking like
>an amateur, this is a SW listening news group.

What does that have to do with anything? I place no distinction between
an
antenna used for transmit, and one receive. They both obey the same
laws.
I use the same types of antennas for both jobs. The better an antenna
is
at transmitting , in general ditto for receive. The properties of an
antenna
between transmit, and receive are reciprical. IE: if an antenna has
gain in a
certain direction, this applies equally transmit, or receive. I will
always
use the best antenna for the job I can put up. And that is rarely ever
a

random wire. Random wires are too micky mouse for my blood.
But you can consider that a personal problem. :/

> A random wire is the
>basic antenna here.

Sure, it may be for some, but I'm sure not all are content
to stay with one antenna their whole life.
I'm just as much as SWL as you are, and my "basic" antenna is
a 1/2 wave dipole. I've been SWLing since 1964, when I got my
first radio at the age of 8. A good bit longer than I've been a ham.
I didn't get into ham radio until the 8th grade. Didn't get legal until
77.
When did you start SWLing? If it's longer than 42 years, I'll give
you a free cookie.

>If you want technical antenna theory then yeah a
>dipole is a basic reference radiator most transmit antennas.

Whether it's for transmit or not is not really relevant.
What other kind of antenna theory is there?
Do they also have "sears" antenna theory, "geico" antenna
theory, "dimbulb" antenna theory, etc?
I thought there was just one version...
Heck, the other guy was the one that brought up what "pro's"
would use or do. Pro's don't measure antennas against
random wires. And I doubt most would use one if they could
use something better. I don't use random wires, and I'm not
even a pro. :/ Are you suggesting I would be a better SWLer
if I changed to random wires? That'll be the day... :/ LOL...

I have an MFJ-1024 on top of a 20' pole that works very well. It behaves exactly like a car radio antenna (which the element actually is). I use it on my little bed side radio (an ICOM R-75) and use it nightly. Caution: when buying antennas from MFJ or Radio Shack, I find the first thing you need to do is take them apart and tighten everything.

The Stoner DA100E is pretty much the same thing, but they may be on hiatus.

A good source of 'cheap' wire for antennas is any hamfest flea market (or possibly any flea market as a matter of fact. You can usually find partial or full spools of it piled in boxes and being sold on the cheap. Some companys that use lots of wire will discard it because they no longer need the color codes on its jackets, or they get rid of partial spools once they get down to a certain amount left. Enterprising employees scoop these up and show up at flea markets with it. It may not be exactly what you would purchase if you were buying 'new' but it will work and in most cases will be just a fraction of what you would pay for something new to do the job.

Think Spring......antenna construction time is fast aproaching.

aka 'Doublet' where you have two equal lengths of wire that are not
cut to any specific frequency, rather they are cut to fit the maximum
dimension you have available. Doublets are typically fed with
twinlead and a tuner is used.

It also works the other way, I sold a compound bow that I had
weighed and estimated shipping to be about $15.00, for good measure
I said $18.00 on the listing, sold it within a few hours and when
I went to ship it UPS wanted $38.00 to ship it to NorthCarolina
fm Texas, I was pissed and told the guy that I had used their
estimation software, no avail! I ate the cost difference in this
case

Radio and print and TV are mass media. They loolk for "people" and there is no way of knowing which ones are ready to buy.

You are making assumptions about the ability to know the listener at the granular level, one by one. There is no economical way to do this. This is why ratings are a poll, not a census.

Going into another medium, the direct mail response rate is seldome even 1% even with the most targeted mailing lists. Still, given cost, that is cost effective. the same is true with radio. Advertisers can narrow down choicdes by knowing the age appeal of thier product vs the appeal of stations, and select accordingly. Other than that, they really have little to deal with as to the desire to buy of the listeners of radio or one station as this may change from day to day or hour to hour.

> cover Boulder for crap. They can and do, however, cover all the way
> down to New Mexico.

As I said before, each market only has a few, a very few, AMs that fully cover it. That goes for Denver, or Cleveland or LA. In fact, due to urban sprawl, Washington DC has not had a single viable AM in this respect for the last 30 years or so. Only those stations, like KOA, will be fully competitive because they cover the market. the rest willhave to figure out niche or brokered options to survive.

Since we are talking about AM, and there are no AMs up on a frikkin' mountain, your whole point is bvery confusing. And no Denver FM covers down to New Mexico.

You do know that the ideal AM site is in salt water, right? Lacking that, it is in the lowest, flattest, wettest, most orgnic soil possible. FMs and TVs

love mountains of the 2000 foot creations of Stainless, but not AMs.

Again we are talking about AM out of market skywave coverage. Coverage which, in Denver, exists on only one station... KOA.

> ever.

It is telling that you had to go back 50 years for one of your examples. There are always misses. The case study for consumer research and being driven by the marketing mode is Procter & Gamble... they create hundreds of new products a year, actually test market a significant percentage (that means they make the product and distribute it in isolated markets to see how it does) and roll out dozens. Yet as many as half do not last 3 years. Consumer tastes change, and sometimes initial impressions do not create long term usage. This is why companies try to have many products under development.
>
> Oh, and no one reads the comic strip Dilbert, because its descriptions

Some are real, some are exaggerations. And many of us work in companies where none of that is true. Mostly,comic strips are exaggerations of real life.
>
> Good thing, too, because I bet that a seller -- that is, a buyer of
> advertising time -- on WLW knows how many units they move in East
> Overshoe, that place that doesn't exist in your world.

But, even if they do get a listener or tow at night outside the Cicny MSA, they do not quantify the sales that way. They look at the sales by region and city and the local ad expenditures to determine effectiveness of the ad campaign.

You are trying to quantify on a grand scale something that does not matter: night DX AM lisatening. You can go through the Arbitron diaries for east Overshoe (every US county is rated at least once a year) and you will not find that WLW gets ratings. So, statistically, it is not a factor even if in reality one or tow people listen occasionally.

When you have, for example, 1.6 million listening to KFI in the LA market, the fact that maybe 3 or 4 people listened in Needles or Barstow or Bishop or somewhere way off in the wilderness is totally insignificant. Does not make a material change in eithe KFI or the people who hear ads on KFI.

And, in most places in the Southwest, Mexican staiton interference has made the usefullness of clears on skywave pretty limited in the last few decades (KFI and KNX are unlistenable 150 miles from LA, for example) and in the Southeast, Cubans and caribbean stations chew up WSB and WLW and stations like that most nights of the year... another reason why these stations do not even try to serve out of market listener groups.

I spend at least half my time in direct contact with listeners or supervising others who are. I travel between 17 US markets, and we see in person at least 10 thousand listeners a year, and talk to anoother 200,000 or more users of our "variety" of radio by phone, conducting interviews with all of them using a staff of about 50 an a budget that is about 6 times greater than the billing of the average radio station in the US. Yes, we know our listeners very well.

> exasperation, "You haven't asked the right question yet." They never
> did.

Irrelevant. Your experience with Quest and the purposes of the survey were
at odds. Maybe the did not want to know your feelings, just your actual
behaviour... in other words, don't tell me what you feel, tell me what you
actually did.

Union members supposedly reject the labor policies, offshoring and health
care policies of WalMarth. Yet 70% of labor union members recently surveyed
shopped at walMart despite that. In other words, a survey based on feelings
would say labor union menbers despise WalMart. And it would not show that
nearly all of them shop there anyway. You have to pin down real behaviour,
not guesses. Consumers can tell you what they have done a lot better than
what they will do... this is why historians are respected and fortune
tellers are not.
>
> And neither do you.

We do all the time. You just will never see proprietary research.

>
> Sure -- drive time. What your next biggest listening period outside
> of rush hour?

Listening is pretty flat form 6 AM to 7 PM. there are small peaks in 6 to 10
and 3 to 7, but they are minor. Since 70% of listening is at home or at
work, the short in-car intervals are overwhelmed by in home and at work
listening, where more time is available. In fact, in some makrets, like New
York, less than 25% of listening is in cars!
>
>> It is nearly 100% listened to in the very

>
> By your massaged, filtered numbers, yes. But you are filtering a
> large number of people out of your survey. They, to you, are down in
> the noise, in the insignificant digits range. But that "noise," added
> up, makes a significant bloc of people.

I am not filtering anyone out. If you look at any station, and look at where
the diary returns come from by work and home location, you find that most

listening is inside the very prime contours. in metros, where AM noise levels are high, about 80% to 85% comes from within the 10 mv/m contours. On FM, it is within the 64 dbu contour. Very little is left outside those contours.

Then you can check if your station showed up in any market area that is not your home market area. In the whole US, only a few hundred out of 13,500 radio stations showed up outside the home market.

Arbitron is very liberal on what it takes to "show" in a market. You only have to appear in 10 diaries and register a certain number of quarter hours of listening to "show" yet, except for contiguous markets on groundwave for AM, AMs do not show in distant markets because there is just not anyone listening. Again, radio listening at night is about 4 times lower than daytime levels so the chances of finding listeners is much harder.

Add to that the fact that there are very few stations on reasonably clear frequencies that can be reliably heard and listened to on skywave (the number is a few dozen out of 5000 AM stations) and all these staitons are programming to local audiences because that is where the big money comes from and you have no listeners of significance outside the groundwave coverage areas.

>
>> Advertisers only use local
>> stations to reach local audiences,
>
> Either because you won't sell them the time, or they are a local
> product (like a bar or a pizza joint), or, gawd help us all, they
> *believe* people like you.

Buying is top down. Advertisers decide what ages, geographies, markets they will use. They tell their ad agency what to buy, and they determine the media mix. Radio simply provides the time.

Radio will sell time to most anything legal. But I have never personally seen a single buy come down for skywave or out of market listeners in the last 45 years or so. Major advertisers advertise by the market. Their entire distribution system is generally regionalized by market and zone, and so are ad budgets. Even national media, like network TV and cable, is allocated by market based on population.

>

The fact is, most ad buys include some type of merchandising or direct support services. It may be something you do not see, like letters to all retailers in a market area saying that Client So and So is advertising on my station, so you had better stock up and give the product good facings to satisfy increased demand... or a contest to give away samples... or cupons done at van hits... or an endorsement by talent... or something that enhances the ad buy and is purely localized.

I can not send talent or vans or whatever to Moreno Valley. Doing so would take 8 hours, including travel time. I could do 4 hits in LA metro in the same time, and that benefits me. It is about logistics, signal and listening patterns.
>
> Oh, and, "99.999999999999%"? Are you sure? You referred to

I was engaging in the same hyperbole you are using.

>
> But you know that. Your station is a top 5 in a market it refuses to
> sell to. Because they don't exist, according to your beloved numbers.

LA ad rates on major staitons are in the $1000 to $2000 per spot range. In Riverside / San Bernardino, the Inland Empire separate market, the local staitons sell for from $60 to a bit over $100 a spot. There is no way I can go in there and offer $2000 spots for the #5 station when the #1 staiton sells for $100 a spot. And that is why major metro stations do not sell in fringe markets, even if they cover them partly or fully.
>
> Once again, because I need to spell these things out for you, I'm not

> otherwise aren't tied to a geographic element, why not do so?
> "Because we don't work that way," is a piss-poor answer.

Almost all Mail Order is PI. We do not talke PI, as the returns are miserable and it is better to play more music or do more talk than to fill the staiton up with non-productive ads that detract fromt he entertainment value.

Chain stores or national products buy ads through agencies. They buy by the market. If you are an LA station and mention Riverside ratings, they say, "but I am buying you for LA, not Riverside. When I buy Riverside, and you want to sell me more spots for $60, give us a ring."
>

> into their market surveys of what people want.

Clear Channel and its component parts literally saved AM radio. In fact, the name of the company reflects on its first purchase, WOAI in San Antonio, a bankrupt AM. They expanded by buying good AMs even in places like Wyoming and Montana and putting on good talk programming and, for all practical purposes, creating or significantly contributed to the model that saved AM.

I am about 600 miles northeast of WHO Des Moines 1040 and hear them on skywave until they fade out. I like to listen to Don Thompson's breakfast program on Sunday morning (7am-8 cst). I find it a delightful mix of music of the 50's/60's, reminiscences of Hollywood, and pleasant talk. I have to report that in the introduction, Don greeted listeners from COAST to COAST and metioned a few towns around the country. Horrors! Heresy! Why is this station greeting dx'ers who won't show up on their ratings book. Are they mad? Eduardo says profit maximize...don't let a cost escape your eyes. WHO is fading out early these days but I did note two commercials: one for a function at the Iowa State Fairgrounds and another announcing a tour of the Canadian maritimes. Whoda thunk it? A station not only greeting am dx'ers but encouraging them.
With reference to CFRX. They use a Harris 1kw transmitter and I would guess that the electric cost would be about $100 a month. They also have an active support group that handles QSL's.
